## Cloud Security Alliance Certificate of Cloud Security Knowledge v5 (CCSKv5.0) Sample Questions (Q155-Q160):

### NEW QUESTION # 155

What is an essential security characteristic required when using multi-tenant technologies?

- A. Resource pooling
- B. Abstraction and automation
- C. Limited resource allocation
- **D. Segmented and segregated customer environments**

**Answer: D**

Explanation:

In multi-tenant technologies, the fundamental security requirement is segmented and segregated customer environments. Multi-tenancy means that multiple customers (tenants) share the same physical or virtual infrastructure while maintaining logical separation to prevent data leakage and unauthorized access between tenants.

To ensure security and compliance in multi-tenant environments, providers implement:

Network segmentation (VLANs, Virtual Private Clouds)

Isolation mechanisms (such as virtual firewalls and access control lists) Data isolation through encryption and access controls

Hypervisor-based isolation in virtualized environments The goal is to create strong logical isolation between tenants to mitigate risks like data leakage, guest-hopping attacks, and unauthorized access.

Why Other Options Are Incorrect:

B . Limited resource allocation: While resource limits may help performance management, they do not inherently ensure security in multi-tenant settings.

C . Resource pooling: Though fundamental to cloud computing, it does not address the isolation needed for secure multi-tenancy.

D . Abstraction and automation: These are key elements in cloud computing but do not directly address multi-tenant security.

### NEW QUESTION # 156

ENISA: Which is a potential security benefit of cloud computing?

- A. Greater compatibility with customer IT infrastructure
- B. Lock-In
- C. Provider can obfuscate system O/S and versions
- D. ISO 27001 certification
- **E. More efficient and timely system updates**

**Answer: E**

### NEW QUESTION # 157

Which of the following best describes the role of program frameworks in defining security components and technical controls?

- A. Program frameworks focus on implementing specific security technologies
- B. Program frameworks evaluate the performance of individual security tools
- **C. Program frameworks help organize overarching security policies and objectives**
- D. Program frameworks primarily define compliance requirements for regulations

**Answer: C**

Explanation:

Program frameworks play a critical role in cloud security by helping to organize overarching security policies and objectives.

Frameworks such as NIST CSF, ISO 27001, or the CSA Cloud Controls Matrix (CCM) provide structured guidance for defining security components, aligning technical controls with business objectives, and ensuring a comprehensive security program.

From the CCSK v5.0 Study Guide, Domain 3 (Governance and Enterprise Risk Management), Section 3.2:

"Program frameworks, such as the CSA CCM or NIST Cybersecurity Framework, provide a structured approach to organizing security policies, objectives, and technical controls. These frameworks help organizations align their security programs with business goals and ensure comprehensive coverage of security requirements." Option C (Program frameworks help organize overarching security policies and objectives) is the correct answer.

Option A (Evaluate the performance of individual security tools) is incorrect because frameworks focus on strategy, not tool performance.

Option B (Focus on implementing specific security technologies) is incorrect because frameworks guide policy, not technology implementation.

Option D (Primarily define compliance requirements) is incorrect because compliance is a subset of framework objectives, not the primary role.

### NEW QUESTION # 158

What is the primary reason dynamic and expansive cloud environments require agile security approaches?

- A. To reduce costs associated with physical hardware
- **B. To quickly respond to evolving threats and changing infrastructure**
- C. To simplify the deployment of virtual machines
- D. To ensure high availability and load balancing

**Answer: B**

Explanation:

Agile security approaches allow organizations to adapt to the rapid changes and emerging threats characteristic of cloud environments. Reference: [Security Guidance v5, Domain 4 - Organization Management]

### NEW QUESTION # 159

The process which frees the resources from their physical constraints to enable pooling is called:

- A. Automation
- **B. Abstraction**
- C. Classification
- D. Orchestration

**Answer: B**

Explanation:

Abstraction, often via virtualization, frees the resources from their physical constraints to enable pooling. Then a set of core connectivity and delivery tools (orchestration) ties these abstracted resources together, creates the pools, and provides the automation to deliver them to customers.
