2026 Splunk SPLK-1003: Splunk Enterprise Certified Admin –High-quality Test Objectives Pdf

Our SPLK-1003 exam prep is elaborately compiled and highly efficiently, it will cost you less time and energy, because we shouldn't waste our money on some unless things. The passing rate and the hit rate are also very high, there are thousands of candidates choose to trust our SPLK-1003 guide torrent and they have passed the exam. We provide with candidate so many guarantees that they can purchase our SPLK-1003 Study Materials no worries. So we hope you can have a good understanding of the SPLK-1003 exam torrent we provide, then you can pass you SPLK-1003 exam in your first attempt.

The SPLK-1003 Exam covers a range of topics, including Splunk Enterprise architecture, deployment, configuration, management, and troubleshooting. Individuals who pass the exam demonstrate their ability to install and configure Splunk Enterprise, manage users and security, monitor and troubleshoot Splunk Enterprise, and optimize its performance. Splunk Enterprise Certified Admin certification is recognized globally and demonstrates a high level of expertise in managing and maintaining Splunk Enterprise.

Splunk Enterprise Certified Admin Sample Questions (Q91-Q96):

NEW QUESTION # 91
A configuration file in a deployed app needs to be directly edited. Which steps would ensure a successful deployment to clients?

- A. Make the change in $SPLUNK_HOME/etc/dep10yment apps/$appName/10ca1/ on the deployment server, and the change will be automatically sent to the deployment clients.
- B. Make the change in $SPLUNK_HOME/etc/apps/$appName/defau1t on the deployment server, and it will be distributed down to the clients' own local versions.
- C. Make the change in $SPLUNK_HOME /etc/apps/$appname/local/ on any of the deployment clients, and then run the command . / splunk reload deploy-server to push that change to the deployment server.
- D. Make the change in $SPLUNK_HOME/etc/dep10yment apps/$appName/10ca1/ on the deployment server, and then run $SPLUNK_HOME/bin/sp1unk reload deploy-server.

Answer: D

Explanation:
Explanation
According to the Splunk documentation1, to customize a configuration file, you need to create a new file with the same name in a local or app directory. Then, add the specific settings that you want to customize to the local configuration file. Never change or copy the configuration files in the default directory. The files in the default directory must remain intact and in their original location. The Splunk Enterprise upgrade process overwrites the default directory.
To deploy configuration files to deployment clients, you need to use the deployment server. The deployment server is a Splunk Enterprise instance that distributes content and updates to deployment clients2. The deployment server uses a directory called $SPLUNK_HOME/etc/deployment-apps to store the apps and configuration files that itdeploys to clients2. To update the configuration files in this directory, you need to edit them manually and then run the command $SPLUNK_HOME/bin/sp1unk reload deploy-server to make the changes take effect2.
Therefore, option A is incorrect because it does not include the reload command. Option B is incorrect because it makes the change on a deployment client instead of the deployment server. Option D is incorrect because it changes the default directory instead of the local directory.

NEW QUESTION # 92
A Universal Forwarder is collecting two separate sources of data (A,B). Source A is being routed through a Heavy Forwarder and then to an indexer. Source B is being routed directly to the indexer. Both sets of data require the masking of raw text strings before being written to disk. What does the administrator need to do to ensure that the masking takes place successfully?

- A. Make sure that props . conf and transforms . conf are both present on the in-dexer and the search head.
- B. Place both props . conf and transforms . conf on the Heavy Forwarder for source A, and place both props . conf and transforms . conf on the indexer for source B.
- C. For source A, make sure that props . conf is in place on the indexer; and for source B, make sure transforms . conf is present on the Heavy Forwarder.
- D. Make sure that props . conf and transforms . conf are both present on the Universal Forwarder.

Answer: B

Explanation:
Explanation
The correct answer is D. Place both props . conf and transforms . conf on the Heavy Forwarder for source A, and place both props . conf and transforms . conf on the indexer for source B.
According to the Splunk documentation1, to mask sensitive data from raw events, you need to use the SEDCMD attribute in the props.conf file and the REGEX attribute in the transforms.conf file. The SEDCMD attribute applies a sed expression to the raw data before indexing, while the REGEX attribute defines a regular expression to match the data to be masked. You need to place these files on the Splunk instance that parses the data, which is usually the indexer or the heavy forwarder2. The universal forwarder does not parse the data, so it does not need these files.
For source A, the data is routed through a heavy forwarder, which can parse the data before sending it to the indexer. Therefore, you need to place both props.conf and transforms.conf on the heavy forwarder for source A, so that the masking takes place before indexing.
For source B, the data is routed directly to the indexer, which parses and indexes the data. Therefore, you need to place both props.conf and transforms.conf on the indexer for source B, so that the masking takes place before indexing.

NEW QUESTION # 93
What is the correct curl to send multiple events through HTTP Event Collector?

- A. Option C
- B. Option B
- C. Option A
- D. Option D

Answer: B

Explanation:
curl "https://mysplunkserver.example.com:8088/services/collector" \ -H "Authorization: Splunk DF4S7ZE4-3GS1-8SFS-E777-0284GG91PF67" \ -d '{"event": "Hello World"}, {"event": "Hola Mundo"}, {"event": "Hallo Welt"}'. This is the correct curl command to send multiple events through HTTP Event Collector (HEC), which is a token-based API that allows you to send data to Splunk Enterprise from any application that can make an HTTP request. The command has the following components:
The URL of the HEC endpoint, which consists of the protocol (https), the hostname or IP address of the Splunk server (mysplunkserver.example.com), the port number (8088), and the service name (services/collector).
The header that contains the authorization token, which is a unique identifier that grants access to the HEC endpoint. The token is prefixed with Splunk and enclosed in quotation marks. The token value (DF4S7ZE4-3GS1-8SFS-E777-0284GG91PF67) is an example and should be replaced with your own token value.
The data payload that contains the events to be sent, which are JSON objects enclosed in curly braces and separated by commas. Each event object has a mandatory field called event, which contains the raw data to be indexed. The event value can be a string, a number, a boolean, an array, or another JSON object. In this case, the event values are strings that say hello in different languages.

NEW QUESTION # 94
What is required when adding a native user to Splunk? (select all that apply)

- A. Username
- B. Password
- C. Full Name
- D. Default app

Answer: A,B

NEW QUESTION # 95
Which Splunk component distributes apps and certain other configuration updates to search head cluster members?

- A. Deployment server
- B. Search head cluster master
- C. Cluster master
- D. Deployer

Answer: A

Explanation:
Explanation
https://docs.splunk.com/Documentation/Splunk/8.0.5/Updating/Updateconfigurations First line says it all:
"The deployment server distributes deployment apps to clients."
