CompTIA Cybersecurity Analyst (CySA+) Certification Exam Sample Questions (Q64-Q69):

NEW QUESTION # 64

A security analyst performs various types of vulnerability scans. Review the vulnerability scan results to determine the type of scan that was executed and if a false positive occurred for each device.

Instructions:

Select the Results Generated drop-down option to determine if the results were generated from a credentialed scan, non-credentialed scan, or a compliance scan.

For ONLY the credentialed and non-credentialed scans, evaluate the results for false positives and check the findings that display false positives. NOTE: If you would like to uncheck an option that is currently selected, click on the option a second time.

Lastly, based on the vulnerability scan results, identify the type of Server by dragging the Server to the results.

The Linux Web Server, File-Print Server and Directory Server are draggable.

If at any time you would like to bring back the initial state of the simulation, please select the Reset All button. When you have completed the simulation, please select the Done button to submit. Once the simulation is submitted, please select the Next button to continue.

NEW QUESTION # 65

The security team at a company, which was a recent target of ransomware, compiled a list of hosts that were identified as impacted and in scope for this incident. Based on the following host list:

□ Which of the following systems was most pivotal to the threat actor in its distribution of the encryption binary via Group Policy?

- A. SQL01
- B. WK10-Sales07
- **C. DCEast01**
- D. WK7-Plant01
- E. HQAdmin9

Answer: C

Explanation:

Based on the list of hosts and their functions, DCEast01, which is a Domain Controller, would be the most pivotal in the distribution of an encryption binary via Group Policy. Domain Controllers are responsible for security and administrative policies within a Windows Domain. Group Policy is a feature of Windows that facilitates a wide range of advanced settings that administrators can use to control the working environment of user accounts and computer accounts. Group Policy can be used to deploy software, which in this case would be the encryption binary of the ransomware. SQL01 is a database server and unlikely to be used for this purpose. WK10-Sales07 and WK7-Plant01 are client machines, and HQAdmin9, although it is a network admin laptop, would not typically be used to distribute policies across a network.

NEW QUESTION # 66

Which of the following is a KPI that is used to monitor or report on the effectiveness of an incident response reporting and communication program?

- A. Incident volume
- **B. Remediated incidents**
- C. Average time to patch
- D. Mean time to detect

Answer: B

Explanation:

Comprehensive and Detailed Step-by-Step Remediated incidents is a key performance indicator (KPI) that measures how effectively incidents are resolved and communicated during the incident response lifecycle. It reflects the program's success in mitigating risks and restoring normal operations. Other options (e.g., mean time to detect) are important metrics but do not directly measure reporting or communication effectiveness.

NEW QUESTION # 67

During an extended holiday break, a company suffered a security incident. This information was properly relayed to appropriate personnel in a timely manner and the server was up to date and configured with appropriate auditing and logging. The Chief Information Security Officer wants to find out precisely what happened. Which of the following actions should the analyst take first?

- A. Restore from the last known-good backup to confirm there was no loss of connectivity
- B. Shut down the affected server immediately
- C. Log in to the affected server and begin analysis of the logs
- **D. Clone the virtual server for forensic analysis**

Answer: D

Explanation:

Explanation

The first action that the analyst should take in this case is to clone the virtual server for forensic analysis.

Cloning the virtual server involves creating an exact copy or image of the server's data and state at a specific point in time. Cloning the virtual server can help preserve and protect any evidence or information related to the security incident, as well as prevent any tampering, contamination, or destruction of evidence. Cloning the virtual server can also allow the analyst to safely analyze and investigate the incident without affecting the original server or its operations.

NEW QUESTION # 68

A security analyst is working on a suspicious email forwarded from a user. The email contains an attachment asking the user to open it. Which of the following should the security analyst review to best determine email authentication and its attack origin?

- A. SMTP
- B. URL rewriting
- C. DMARC
- D. Joe Sandbox

Answer: C

Explanation:

DMARC results in the email headers show whether the message passed or failed authentication checks such as SPF and DKIM. Reviewing these results helps determine whether the sender was spoofed and provides insight into the likely origin of the attack.
