

HashiCorp Terraform-Associate-003認定試験に合格する秘訣がわかる？

無料でクラウドストレージから最新のGoShiken Terraform-Associate-003 PDFダンプをダウンロードする：<https://drive.google.com/open?id=17jqKypsm-w1ncKaevnvyXxKWTppERvDc>

もしあなたはまだHashiCorpのTerraform-Associate-003試験に合格するために悩まればGoShikenは今あなたを助けることができます。GoShikenは高品質の学習資料をあなたを助けて優秀なHashiCorpのTerraform-Associate-003会員の認証を得て、もしあなたはHashiCorp Terraform-Associate-003の認証試験を通して自分を高めるの選択を下ろして、GoShikenはとてもよい選択だと思います。

HashiCorp Terraform-Associate-003 認定試験の出題範囲：

トピック	出題範囲
トピック 1	Manage resource lifecycle: The section covers topics such as Initializing a configuration using terraform init and its options and generating an execution plan using terraform plan and its options. It also covers the configuration changes using Terraform Apply and its options.
トピック 2	Create, maintain, and use Terraform modules: In this section of the exam, candidates are tested for creating a module, using a module in configuration, and topics such as refactoring an existing configuration into modules.
トピック 3	Develop collaborative Terraform workflows: In this section, candidates are tested for their skills related to managing the Terraform binary, providers, and modules using version constraints and setting up remote states. It also covers the utilization of the Terraform workflow in automation.
トピック 4	Develop and troubleshoot dynamic configuration: This section deals with topics such as using language features to validate configuration query providers using data sources, computing and interpolating data using HCL functions, and using meta-arguments in configuration.
トピック 5	Configure and use Terraform providers: In this section, topics covered include understanding Terraform's plugin-based architecture and configuring providers. It also covers aliasing, sourcing, and versioning functions.

Terraform-Associate-003 HashiCorp Certified: Terraform Associate (003) (HCTA0-003)資格問題集、Terraform-Associate-003練習問題

社会に入った後の私達は最もの責任があって、学習の時間は少なくなりました。IT領域により良く発展したい

なら、HashiCorp Terraform-Associate-003のような試験認定資格を取得するのは重要なことです。周知のようにHashiCorp Terraform-Associate-003のような試験認定資格を手に入れると、会社の規則に沿う奨励があります。それで、速く我々GoShikenのHashiCorp Terraform-Associate-003試験問題集を入手しましょう。

HashiCorp Certified: Terraform Associate (003) (HCTA0-003) 認定 Terraform-Associate-003 試験問題 (Q58-Q63):

質問 # 58

Which is the best way to specify a tag of v1.0.0 when referencing a module stored in Git (for example, `Git::https://example.com/vpc.git`)?

- A. Append `pref=v1.0.0` argument to the source path
- B. Add `version = "1.0.0"` parameter to module block
- C. Nothing modules stored on GitHub always default to version 1.0.0

正解: A

解説:

The best way to specify a tag of v1.0.0 when referencing a module stored in Git is to append `?ref=v1.0.0` argument to the source path. This tells Terraform to use a specific Git reference, such as a branch, tag, or commit, when fetching the module source code. For example, `source = "git::https://example.com/vpc.git?ref=v1.0.0"`. This ensures that the module version is consistent and reproducible across different environments.

References = [Module Sources], [Module Versions]

質問 # 59

Terraform can only manage resource dependencies if you set them explicitly with the `depends_on` argument.

- A. True
- B. False

正解: B

解説:

Terraform can manage resource dependencies implicitly or explicitly. Implicit dependencies are created when a resource references another resource or data source in its arguments. Terraform can infer the dependency from the reference and create or destroy the resources in the correct order. Explicit dependencies are created when you use the `depends_on` argument to specify that a resource depends on another resource or module. This is useful when Terraform cannot infer the dependency from the configuration or when you need to create a dependency for some reason outside of Terraform's scope. Reference = : Create resource dependencies : Terraform Resource Dependencies Explained

質問 # 60

How does the Terraform cloud integration differ from other state backends such as S3, Consul, etc?

- A. It doesn't show the output of a terraform apply locally
- B. All of the above
- C. It can execute Terraform runs on dedicated infrastructure in Terraform Cloud
- D. It is only arable lo paying customers

正解: C

解説:

This is how the Terraform Cloud integration differs from other state backends such as S3, Consul, etc., as it allows you to perform remote operations on Terraform Cloud's servers instead of your local machine. The other options are either incorrect or irrelevant.

質問 # 61

Which two steps are required to provision new infrastructure in the Terraform workflow? Choose two correct answers.

- A. Alidate
- **B. apply**
- C. Plan
- **D. Init**
- E. Import

正解: B、D

解説:

The two steps that are required to provision new infrastructure in the Terraform workflow are init and apply. The terraform init command initializes a working directory containing Terraform configuration files. It downloads and installs the provider plugins that are needed for the configuration, and prepares the backend for storing the state. The terraform apply command applies the changes required to reach the desired state of the configuration, as described by the resource definitions in the configuration files. It shows a plan of the proposed changes and asks for confirmation before making any changes to the infrastructure. Reference = [The Core Terraform Workflow], [Initialize a Terraform working directory with init], [Apply Terraform Configuration with apply]

質問 # 62

Define the purpose of state in Terraform.

- A. State stores variables and lets you quickly reuse existing code
- **B. State maps real world resources to your configuration and keeps track of metadata**
- C. State codifies the dependencies of related resources
- D. State lets you enforce resource configurations that relate to compliance policies

正解: B

解説:

The purpose of state in Terraform is to keep track of the real-world resources managed by Terraform, mapping them to the configuration. The state file contains metadata about these resources, such as resource IDs and other important attributes, which Terraform uses to plan and manage infrastructure changes. The state enables Terraform to know what resources are managed by which configurations and helps in maintaining the desired state of the infrastructure.

References = This role of state in Terraform is outlined in Terraform's official documentation, emphasizing its function in mapping configuration to real-world resources and storing vital metadata .
