Online Engine Development-Lifecycle-and-Deployment-Architect Real Exam Questions

We trounce many peers in this industry by our justifiably excellent Development-Lifecycle-and-Deployment-Architect training guide and considerate services. So our Development-Lifecycle-and-Deployment-Architect exam prep receives a tremendous ovation in market over twenty years. All these years, we have helped tens of thousands of exam candidates achieve success greatly. For all content of our Development-Lifecycle-and-Deployment-Architect Learning Materials are strictly written and tested by our customers as well as the market. Come to try and you will be satisfied!

Salesforce Certified Development Lifecycle and Deployment Architect Sample Questions (Q37-Q42):

NEW QUESTION # 37

Universal Containers is a global organization that maintains regional production instances of Salesforce. One region has created a new custom object to track Shipping Containers. The CIO has requested that this new object be used globally by all Salesforce instances and further maintained and modified regionally by local administrators. Which two deployment tools will support this request? Choose 2 answers

- A. Tooling API
- B. Force.com Migration Tool
- C. Force.com IDE

- D. Change sets

Answer: B,C

Explanation:

B and D are the correct answers, as Force.com IDE and Force.com Migration Tool are the deployment tools that will support the request of creating a new custom object to track Shipping Containers and making it available globally by all Salesforce instances and further maintained and modified regionally by local administrators. Force.com IDE and Force.com Migration Tool are both tools that use the Metadata API to retrieve and deploy metadata components, such as custom objects, from one org to another. They also allow for selective deployment, meaning that only the components that are needed can be deployed, without affecting the rest of the org. A is incorrect, as Tooling API is not a deployment tool, but an API that provides access to metadata and code, as well as customizing and automating the development process. C is incorrect, as Change sets are not a deployment tool that will support the request, as they are limited to deploying components between connected orgs, and do not allow for selective deployment or regional modifications.

You can learn more about these tools in the [Deploy Changes with the Force.com Migration Tool](#) and [Deploy Changes with the Force.com IDE](#) units on Trailhead.

NEW QUESTION # 38

Universal Containers (UC) is preparing for the new Salesforce release in a couple of months, and has several ongoing development projects that may be affected. Which three steps should the team at UC take to prepare for this release? Choose 3 answers

- A. Run regression tests in an upgraded sandbox to detect any issues with the Upgrade.
- B. Refresh a Sandbox during the Release Preview Window to ensure they have the upcoming release.
- C. Review the release notes for automatically-enabled features and technical debt.
- D. Upgrade any SOAP integrations to the newest WSDL as early as possible
- E. Contact Salesforce to schedule a time to upgrade the full Sandbox.

Answer: A,B,C

NEW QUESTION # 39

Universal Containers (UC) environment management architect is using the package development model for deployment to different orgs.

Which metadata changes does the architect need to track manually?

- A. All metadata changes for the release.
- B. No manual tracking required. All changes are automatically tracked.
- C. Changes to components not yet supported by source tracking.
- D. Only the changes made via the Setup UI.

Answer: C

Explanation:

The package development model relies on source tracking to automatically track the metadata changes in the package project. However, not all metadata components are supported by source tracking, and some changes may need to be tracked manually. For example, changes to profiles, permission sets, custom metadata types, and custom settings are not supported by source tracking. You can find the list of unsupported components [here](#)¹. No manual tracking is required for the changes that are supported by source tracking, nor for the changes made via the Setup UI, as they are automatically captured by the package development model.

NEW QUESTION # 40

Universal Containers has three types of releases in their release management strategy: daily, minor (monthly), and major (quarterly). A user has requested a new report to support an urgent client request. What release strategy would an Architect recommend?

- A. Utilize the major release process to create the report directly in production bypassing the full sandbox.
- B. Utilize the daily release process to create the report directly in a full sandbox and then deploy it to production.
- C. Utilize the minor release process to create the report directly in production bypassing the full sandbox.
- D. Utilize the major release process to create the report in a full sandbox and then deploy it to production.

Answer: B

Explanation:

The daily release process is the most suitable for creating a new report to support an urgent client request, as it can deliver the functionality in a timely manner. Creating the report in a full sandbox and then deploying it to production can ensure the quality and security of the report.

NEW QUESTION # 41

Universal Containers has three types of releases in its release management strategy: daily, minor (monthly), and major (quarterly). A user has requested a new report to support an urgent client request. What release strategy would an Architect recommend?

- A. Utilize the major release process to create the report directly in production bypassing the full sandbox.
- **B. Utilize the daily release process to create the report directly in a full sandbox and then deploy it to production.**
- C. Utilize the minor release process to create the report directly in production bypassing the full sandbox.
- D. Utilize the major release process to create the report in a full sandbox and then deploy it to production.

Answer: B

Explanation:

Explanation

The best release strategy for creating a new report to support an urgent client request is to utilize the daily release process. The daily release process is designed for small and quick changes that do not require extensive testing or approval. The daily release process can create the report directly in a full sandbox and then deploy it to production. The major and minor release processes are more suitable for large and complex changes that require more testing and approval. The major and minor release processes should not create the report directly in production, as this may cause errors or conflicts.

NEW QUESTION # 42

.....

Along with the three version of our Development-Lifecycle-and-Deployment-Architect exam braindumps: the PDF, Software and APP online, we also offer you the best practicing opportunity to ace exam in your first try. They are the special trial versions-the free demos of the Development-Lifecycle-and-Deployment-Architect practice engine that provides you the latest questions and answers to have a try on not only the content but also the displays.
