With our excellent C\_CPI\_2506 exam questions, you can get the best chance to obtain the C\_CPI\_2506 certification to improve yourself, for better you and the better future. With our C\_CPI\_2506 training guide, you are acknowledged in your profession. The C\_CPI\_2506 exam braindumps can prove your ability to let more big company to attention you. Then you have more choice to get a better job and going to suitable workplace. Why not have a try on our C\_CPI\_2506 Exam Questions, you will be pleasantly surprised our C\_CPI\_2506 exam questions are the best preparation material.

In this version, you don't need an active internet connection to use the C\_CPI\_2506 practice test software. This software mimics the style of real test so that users find out pattern of the real test and kill the exam anxiety. TopExamCollection offline practice exam is customizable and users can change questions and duration of SAP Certified Associate - Integration Developer (C\_CPI\_2506) mock tests. All the given practice questions in the desktop software are identical to the SAP Certified Associate - Integration Developer (C\_CPI\_2506) actual test.

## Quiz 2026 High Pass-Rate SAP C\_CPI\_2506 Exam Voucher

The TopExamCollection is committed to ace the C\_CPI\_2506 exam preparation at any cost. To achieve this objective the TopExamCollection has hired a team of experienced and certified SAP C\_CPI\_2506 exam trainers. They work together and put all

their expertise to offer TopExamCollection C\_CPI\_2506 Exam Questions in three different formats. These three C\_CPI\_2506 exam practice question formats are PDF file, desktop practice test software, and web based practice test software.

## SAP C\_CPI\_2506 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>• SAP Integration Suite Overview: This section of the exam measures the skills of Integration Consultants and covers the foundational concepts of the SAP Integration Suite. It provides an understanding of the suite's capabilities, its role in connecting applications, and its relevance in modern cloud-based integration scenarios.</li></ul>
Topic 2	<ul style="list-style-type: none"><li>• Implementing Cloud Integration: This section of the exam measures the skills of Integration Consultants and examines how cloud integration flows are designed and deployed. It emphasizes creating integration scenarios, handling connectivity, and applying best practices to build efficient, secure, and reliable integration processes in SAP's cloud environment.</li></ul>
Topic 3	<ul style="list-style-type: none"><li>• SAP Event Mesh: This section of the exam measures the skills of Solution Architects and centers on using SAP Event Mesh to support event-driven integration. It highlights the importance of asynchronous communication, event publishing, and subscription models, allowing organizations to build scalable and decoupled systems.</li></ul>
Topic 4	<ul style="list-style-type: none"><li>• Managing APIs: This section of the exam measures the skills of Solution Architects and focuses on managing APIs within the SAP ecosystem. It covers topics such as API provisioning, lifecycle management, security policies, and monitoring, ensuring candidates can handle APIs effectively for enterprise integration needs.</li></ul>

## SAP Certified Associate - Integration Developer Sample Questions (Q42-Q47):

### NEW QUESTION # 42

Which of the following can you use for an XSLT mapping in an integration flow?

- A. XML
- B. PHP
- C. JSON
- D. HTML

**Answer: A**

Explanation:

XSLT (Extensible Stylesheet Language Transformations) is a language designed to transform XML documents into other XML or text formats.

In SAP Cloud Integration, XSLT mapping can only be applied when the payload is in XML format.

For JSON payloads, you would first convert JSON # XML, then apply XSLT mapping.

Other options:

HTML # Not used for XSLT mapping.

JSON # Requires conversion first, cannot be directly used.

PHP # A programming language, unrelated to mappings.

### NEW QUESTION # 43

To activate the Event Mesh (EMIS) capability in the SAP Integration Suite, which role collections must be assigned to the user performing the activation?

- A. Integration\_Provisioner and Subaccount Administrator
- B. Integration\_Administrator and Security\_Auditor
- C. API\_Manager and Monitoring-Viewer

- D. Process\_orchestrator and Subaccount\_Viewer

**Answer: A**

Explanation:

To activate Event Mesh (EMIS) capability in SAP Integration Suite, the required role collections are:

Integration\_Provisioner # Allows provisioning of new capabilities (including Event Mesh) in Integration Suite.

Subaccount Administrator # Grants permission to manage and configure subaccount-level entitlements and service activations.

Other options:

Integration\_Administrator, API\_Manager, Monitoring\_Viewer # Used for operational tasks, not provisioning.

Process\_orchestrator # Refers to on-premise PI/PO, not BTP roles.

Security\_Auditor # Auditing role, not activation.

Thus, the correct roles are Integration\_Provisioner and Subaccount Administrator.

#### NEW QUESTION # 44

What can you use to prevent overload in an OData request and reply call?

- A. Query filter
- B. Stop parameter
- C. HTTP adapter
- **D. Paging**

**Answer: D**

Explanation:

To prevent overload in an OData request and reply call, you can use paging. Paging is a technique that allows you to retrieve a large number of data sets in smaller chunks or pages. You can use the OData query options \$top and \$skip to specify how many records you want to fetch and how many records you want to skip in each request. This reduces the network load and improves the performance of the OData service. Reference: OData API | SAP Help Portal, SAP Integration Suite: enrich a payload with OData Service | SAP Blogs

#### NEW QUESTION # 45

Which Sap platform serves as the foundation for SAP' s integration strategy?

- A. SAP Cloud Platform Integration (CPI) serves as the foundation for SAP' s integration strategy.
- B. SAP Netweaver Process Integration (PI) serves as the foundation for SAP' s integration strategy.
- **C. SAP Business Technology Platform (SAP BTP).**
- D. SAP S/4HANA serves as the foundation for SAP' s integration strategy.

**Answer: C**

Explanation:

SAP's integration strategy is founded on the SAP Business Technology Platform (BTP), which provides:

Integration Suite as the strategic iPaaS for process, data, API, and event-driven integration.

Extension Suite for app extensions.

Database & Data Management for unified data access.

Analytics & AI capabilities.

Other options:

SAP CPI # Now part of Integration Suite, not the overall foundation.

SAP S/4HANA # The digital core ERP, but not the integration platform.

SAP NetWeaver PI/PO # Legacy middleware, replaced strategically by Integration Suite on BTP.

Thus, the foundation of SAP's integration strategy is SAP BTP.

#### NEW QUESTION # 46

What is a characteristic of a product in the API Management capability within SAP Integration Suite?

- A. It encapsulates the API provider.
- **B. It is deployed as a separate artifact on the API business hub enterprise.**

- C. It is a separate artifact and is required for basic authentication.

## Answer: B

### Explanation:

In the context of the API Management capability within SAP Integration Suite, a product is a logical entity that groups and encapsulates one or more APIs, API proxies, or API providers to expose them to consumers in a controlled and manageable way. The key characteristic of a product is that it encapsulates the API provider

, allowing developers to bundle related APIs, define access policies, and manage their lifecycle for specific use cases or consumers.

Why Option C is Correct:

\* Role of a Product in SAP API Management: In SAP Integration Suite's API Management capability, a product serves as a container that encapsulates the API provider (the backend system or service exposing the APIs) and its associated APIs or API proxies. This encapsulation allows for centralized management of access, security policies (e.g., authentication, rate limiting), and monetization settings.

Products enable API providers to be exposed to consumers (e.g., developers or applications) in a structured manner, often through the API Business Hub Enterprise or developer portals.

\* SAP Reference: According to the SAP Integration Suite - API Management Guide on the SAP Help Portal, a product is defined as "a collection of APIs that are grouped together to provide a specific business capability or service to API consumers." It encapsulates the API provider's endpoints and applies policies to manage access and usage. For example, a product might encapsulate an API provider for an SAP S/4HANA system, exposing APIs like SalesOrder or Customer to external applications.

\* Practical Usage: In SAP API Management, an Integration Developer creates a product in the API Portal, associates it with an API provider (e.g., an SAP backend system or a third-party service), and configures policies such as OAuth or API key authentication. The product is then published to the API Business Hub Enterprise or a developer portal, where consumers can discover and subscribe to it.

Why Other Options are Incorrect:

\* A. It is deployed as a separate artifact on the API business hub enterprise: While products are published to the API Business Hub Enterprise (or a custom developer portal) for discovery by consumers, they are not deployed as separate artifacts. In SAP API Management, an artifact refers to entities like API proxies or integration flows, whereas a product is a logical grouping of APIs and their providers, not a standalone deployable entity. The product is managed within the API Portal and exposed via the hub, but it is not "deployed" as an artifact.

\* B. It is a separate artifact and is required for basic authentication: A product is not a separate artifact, nor is it specifically required for basic authentication. Basic authentication is a policy that can be applied to an API or API proxy within a product, but it is not a defining characteristic of the product itself. Products are about encapsulation and management of APIs, not about enforcing a specific authentication mechanism like basic authentication.

SAP Integration Developer Workflow Example:

\* Create API Provider: In the SAP Integration Suite's API Portal, the developer defines an API provider, specifying the backend system (e.g., an SAP Gateway service or a third-party REST service) and its connection details.

\* Develop API Proxies: Create API proxies that expose specific endpoints of the API provider, applying policies like security or rate limiting.

\* Create a Product: Group one or more API proxies under a product in the API Portal, configuring access policies and usage limits. For example, a "Customer Management" product might encapsulate APIs for customer data retrieval and updates.

\* Publish to API Business Hub Enterprise: Publish the product to the API Business Hub Enterprise or a custom developer portal, where consumers can discover and subscribe to it.

\* Consumer Access: External applications or developers subscribe to the product, receiving credentials (e.g., API keys or OAuth tokens) to access the encapsulated APIs.

References:

SAP Help Portal: SAP Integration Suite - API Management Guide - "API Products" section, which describes products as entities that encapsulate API providers and their APIs to manage access and exposure to consumers.

SAP API Management Developer Guide: Details the process of creating and managing products, emphasizing their role in encapsulating API providers and applying policies.

SAP Community Blogs: Articles like "Getting Started with SAP API Management" explain how products are used to bundle APIs and expose them via the API Business Hub Enterprise.

SAP Integration Suite Documentation: Highlights the role of products in facilitating controlled access to API providers in integration scenarios.

## NEW QUESTION # 47

.....

We always learned then forget, how to solve this problem, the answer is to have a good memory method, our C\_CPI\_2506 exam question will do well on this point. Our C\_CPI\_2506 real exam materials have their own unique learning method, abandon the
