The countless candidates have already passed their CDP Data Engineer - Certification Exam (CDP-3002) certification exam and they all used the real, valid, and updated CDP-3002 exam questions. So, why not, take a decision right now and ace your CDP Data Engineer - Certification Exam (CDP-3002) exam preparation with top-notch Cloudera CDP-3002 exam questions?

Cloudera CDP Data Engineer - Certification Exam Sample Questions (Q170-

Q175):

NEW QUESTION # 170

What is the significance of "Sort Merge Join" appearing in an Explain Plan in Cloudera's SQL engines?

- A. It suggests that the join operation is performed without sorting, leading to faster execution
- B. It signifies that the join operation is performed by sorting and then merging two datasets, which can be efficient for large, sorted datasets
- C. It is the least preferred join method due to its high CPU usage
- D. It indicates that the query will benefit from additional indexes

Answer: B

Explanation:

A). "Sort Merge Join" involves sorting two datasets and then merging them based on the join condition. This method can be efficient for large datasets that are already sorted or partially sorted, as it leverages the order of data to reduce the computational overhead of the join operation.

NEW QUESTION # 171

You're working with a complex data pipeline involving both Spark and Hive operations. How can you ensure data consistency and avoid data corruption across different stages?

- A. Rely solely on Spark's checkpointing capabilities
- B. Leverage ACID transactions in both Spark and Hive
- C. Manually manage data consistency through custom code
- D. Use separate clusters for Spark and Hive processing

Answer: B

Explanation:

While options A and D might address specific aspects, they lack a complete solution. Custom code B can be error-prone. ACID (Atomicity, Consistency, Isolation, Durability) transactions ensure data consistency across all operations, regardless of whether data resides in Spark or Hive.

NEW QUESTION # 172

Your project involves integrating Spark with a NoSQL database, MongoDB. You need to write a DataFrame 'df' into a MongoDB collection named 'orders'. Which PySpark code snippet correctly achieves this?

- A.

```
df.write.mongo("mongodb://localhost:27017/dbname.orders")
```
- B.

```
df.write.format("org.apache.spark.sql.mongo").option("uri", "mongodb://localhost:27017/dbname.orders").save()
```
- C.

```
df.write.format("com.mongodb.spark.sql").option("uri", "mongodb://localhost:27017/dbname.orders").save()
```
- D.

```
df.write.format("mongo").option("uri", "mongodb://localhost:27017/dbname.orders").save()
```

Answer: C

Explanation:

Option B is correct as it uses the official MongoDB Spark connector C com.mongodb.spark.sql) and specifies the URI correctly, pointing to the MongoDB collection.

NEW QUESTION # 173

You are processing a large dataset using Spark and need to ensure that the results are available for subsequent stages without recomputing. Which approach achieves this efficiently?

- A. Use `rdd.persist()` with the appropriate storage level based on your needs
- B. Store the data in a temporary table using Spark SQL
- C. Leverage Spark's automatic checkpointing mechanism
- D. Implement custom logic to save the data to HDFS between stages

Answer: A

Explanation:

While other options might work, `rdd.persist()` is the recommended approach for Spark's distributed persistence. It allows you to specify the storage level (e.g., `MEMORY_ONLY`, `MEMORY_AND_DISK`) for intermediate RDDs, ensuring they are available for future stages without recomputing, improving efficiency and performance.

NEW QUESTION # 174

How can "Explain Plan" help in optimizing query performance regarding data partitioning?

- A. By indicating whether the query is able to take advantage of partition pruning
- B. By showing the number of partitions created on the fly
- C. By revealing the encryption method used for partitioned data
- D. By displaying the total size of all partitions

Answer: A

Explanation:

An Explain Plan can demonstrate whether a query can benefit from partition pruning, which is a technique to skip over irrelevant partitions based on query conditions, thereby improving query performance by reducing the amount of data scanned.
