NEW QUESTION # 67
When is a shunt trip operated to power down an elevator?

- A. When a smoke detector is tripped
- B. When a heat detector is tripped
- C. When a pull station is activated
- D. When a sprinkler head is activated

Answer: D

Explanation:
Elevators must be shut down when there is water discharge in the hoistway to prevent electrical hazards and damage. This shutdown is done using a shunt trip breaker.
NFPA 72 (2022), Section 21.4.2:
"Where sprinklers are located in the elevator machine room, control space, or hoistway, means shall be provided to automatically disconnect the main power supply to the elevator prior to the application of water." This is triggered by a waterflow switch or heat detector, but the standard design uses the sprinkler head activation as the point of shutdown via heat detector.
Important: While the heat detector usually triggers the shunt trip, the sprinkler head activation is the condition being detected.
Correct answer: D. When a sprinkler head is activated

NFPA 72 (2022), Section 26.6.4.4.4.2.3:
