NEW QUESTION # 11
Which one of the following is a core objective of a Business Value in an organization?

- A. Reducing Costs
- B. Increasing Sales
- C. Reducing the Deficit
- D. None of the above

Answer: D

Explanation:
According to the EPI Data Centre Professional (CDCP®) Reference Materials, a core objective of a Business Value in an organization is to create value for customers and stakeholders1. This means delivering products or services that meet or exceed customer expectations, while also generating profits or benefits for the organization and its shareholders. Reducing costs, reducing the deficit, and increasing sales are possible ways to achieve this objective, but they are not the core objective itself.

NEW QUESTION # 12
systems are designed specifically to protect the structure of a building.

- A. Total Flooding
- B. Inergen
- C. Pro-inert
- D. Water sprinkler

Answer: D

Explanation:
Water sprinkler systems are designed to protect the structure of a building from fire by suppressing or extinguishing the flames with water. Water sprinkler systems are typically installed in the ceiling or walls of a building and are activated by heat or smoke detectors. Water sprinkler systems can reduce the risk of fire spreading and causing structural damage to the building.

NEW QUESTION # 13
Does shielded twisted pair network cabling provide protection against EMF from power cables?

- A. No, the shielding is designed for alien cross-talk between network cables, it provides no or little protection against low frequency EMF.
- B. Yes, as the shielding for twisted pair network cabling is specifically design for low frequency EMF protection.
- C. No, the shielding for twisted pair network cabling is for physical protection against vandalism and accidental cutting of the cable.
- D. Yes, but only if the power cable is placed in a tre-foil cable arrangement.

Answer: A

Explanation:
Shielded twisted pair cables (STP) are Ethernet cables that feature additional protection against electromagnetic interference from external sources, such as radio waves, microwaves, or other network cables. This is achieved by wrapping each pair of wires with a conductive shield, usually made of foil or braided wire, and then enclosing the entire cable with another shield layer. However, this shielding is not effective against low frequency electromagnetic fields (EMF) from power cables, which can induce currents and voltages in the network cables and cause signal distortion or data loss. Low frequency EMF can only be reduced by increasing the

distance between the power and network cables, or by using a tre-foil cable arrangement, which is a special configuration of three power cables twisted together to cancel out the magnetic fields they generate.
