Managing-Cloud-Security questions & answers cover all the key points of the real test. With the Managing-Cloud-Security training pdf, you can get the knowledge you want in the actual test, so you do not need any other study material. If the Managing-Cloud-Security exam is coming and the time is tense, it is better to choose our Managing-Cloud-Security Test Engine dumps. Managing-Cloud-Security test engine can simulate the actual test during the preparation and record the wrong questions for our reviewing. You just need 20-30 hours for preparation and feel confident to face the Managing-Cloud-Security actual test.

The ValidTorrent recognizes that WGU Managing-Cloud-Security aspirants are constantly juggling multiple responsibilities, so questions are ideal for quick preparation. Applicants can access these questions anywhere and at any time, using any smart device, which allows them to learn at their own pace. The WGU Managing Cloud Security (JY02) (Managing-Cloud-Security) Questions are portable and you can also print them.

When you are studying for the Managing-Cloud-Security exam, maybe you are busy to go to work, for your family and so on. How to cost the less time to reach the goal? It's a critical question for you. Time is precious for everyone to do the efficient job. If you want to get good Managing-Cloud-Security prep guide, it must be spending less time to pass it. Exactly, our product is elaborately composed with major questions and answers. We are choosing the key from past materials to finish our Managing-Cloud-Security Guide Torrent. It only takes you 20 hours to 30 hours to do the practice. After your effective practice, you can master the examination point from the Managing-Cloud-Security exam torrent. Then, you will have enough confidence to pass it.

WGU Managing Cloud Security (JY02) Sample Questions (Q151-Q156):

NEW QUESTION # 151

Which security threat occurs when authorized users increase their level of access in an unauthorized manner?

- **A. Escalation of privilege**
- B. Segregation of duties
- C. Man-in-the-middle
- D. Role assumption

Answer: A

Explanation:

Escalation of privilege occurs when an authorized user gains higher access rights than originally granted, without proper authorization. Managing Cloud principles describe this threat as particularly dangerous because it involves legitimate credentials being abused rather than external attackers breaching the system.

In cloud environments, privilege escalation may occur due to misconfigured access controls, vulnerable applications, or excessive permissions. Once elevated access is obtained, a user can modify configurations, access sensitive data, or disrupt services beyond

their intended role. This directly violates the principle of least privilege and increases the impact of insider threats.

The other options do not describe this scenario. Man-in-the-middle attacks intercept communications, role assumption is a legitimate access mechanism when properly authorized, and segregation of duties is a control designed to prevent abuse. Therefore, escalation of privilege is the correct answer.

NEW QUESTION # 152

An engineer needs to create segmentation using the built-in tools provided by the company's cloud provider.

The InfoSec team has given the engineer directions to limit traffic using a security group between two cloud deployments in the organization. Which mechanisms should the engineer use to create this segmentation?

- A. Unique identifiers and protocols
- **B. Ports and protocols**
- C. Definitions and protocols
- D. MAC addresses and protocols

Answer: B

Explanation:

Cloud security groups typically filter traffic based on ports and protocols. By allowing or denying specific port/protocol combinations, engineers can control communication between deployments. For example, permitting HTTPS (TCP port 443) while blocking other ports enforces segmentation.

MAC addresses are not used in cloud-level segmentation because they apply to physical networks. Unique identifiers and definitions are not practical mechanisms for traffic filtering.

Using ports and protocols aligns with the principle of least privilege by ensuring that only necessary communication pathways exist.

In multi-deployment or hybrid cloud setups, this reduces the attack surface and prevents lateral movement by malicious actors.

Security groups thereby provide logical network segmentation without requiring physical infrastructure changes.

NEW QUESTION # 153

What is a risk in using the community cloud over the private cloud?

- A. Lack of physical resources
- **B. Loss of policy control**
- C. Loss of trained personnel
- D. Lack of virtual instances

Answer: B

Explanation:

A loss of policy control is a key risk when using a community cloud compared to a private cloud. Managing Cloud principles explain that community clouds are shared by multiple organizations with common objectives, compliance needs, or industry requirements.

Because governance is shared across participants, individual organizations may have reduced ability to enforce customized security policies, configurations, or controls. Policy decisions often require consensus, which can limit flexibility and slow response to emerging risks.

Private clouds provide full control over governance, security policies, and configurations. The other options are not inherent risks of community cloud models. Therefore, loss of policy control is the correct answer.

NEW QUESTION # 154

An organization is considering using vendor-specific application programming interfaces (APIs) and internal tools to set up a new service. However, the engineers are against this plan and are advocating for a new policy to prevent issues that could arise. Which common concern in cloud applications are the engineers concerned about?

- A. Reliability
- B. Availability
- C. Scalability
- **D. Portability**

Answer: D

Explanation:

The engineers are concerned about portability. Vendor-specific APIs and tools create a dependency on a single provider, leading to vendor lock-in. This limits the ability to migrate services or workloads to another provider without significant rework.

Reliability and availability refer to service uptime and continuity, while scalability addresses performance under demand. Although important, none of these directly relate to cross-platform flexibility. Portability ensures that services, data, and applications can be easily moved or integrated across environments.

By adopting portable solutions—such as open standards, containerization, and multi-cloud strategies—organizations reduce long-term risks, increase negotiation power with providers, and enhance resilience.

NEW QUESTION # 155

Which technology prevents the environment from being over-controlled with performance-degrading security measures for applications?

- A. Distributed Denial of Service (DDoS)
- B. Intrusion Detection System (IDS)
- C. Runtime Application Self-Protection (RASP)
- D. Quality of Service (QoS)

Answer: C

Explanation:

Runtime Application Self-Protection (RASP) prevents environments from being over-controlled with performance-degrading security measures. Managing Cloud guidance explains that RASP operates from within the application, monitoring behavior and responding to threats in real time.

Because RASP provides contextual awareness of application logic, it reduces the need for excessive external security controls such as heavy network filtering or constant scanning. This minimizes performance impact while maintaining effective protection against attacks like injection, unauthorized access, and misuse of application functions.

QoS manages traffic prioritization, DDoS describes an attack type, and IDS detects threats but does not prevent over-control. Therefore, RASP is the correct technology.
