ISQI CTFL-AcT試験の準備方法 | 100%合格率のCTFL-AcT資格関連題試験 | 効率的なISTQB Foundation Level - Acceptance Testing認定資格試験問題集

ISQIさまざまな種類の候補者がCTFL-AcT認定を取得する方法を見つけるために、多くの研究が行われています。シラバスの変更および理論と実践の最新の進展に応じて、CTFL-AcTテストトレントを修正および更新します。CTFL-AcT認定トレーニングは、厳密な分析による近年のテストと業界動向に基づいています。したがって、お客様のISTQB Foundation Level - Acceptance Testingのために、より多くの選択肢が用意されています。試験のためにCTFL-AcT試験問題を選択することをお勧めします。

ISQI ISTQB Foundation Level - Acceptance Testing 認定 CTFL-AcT 試験問題 (Q46-Q51):

質問 # 46

As an acceptance tester you are analyzing the following user story for a computer web-based mass multiplayer role-playing game:
As an unregistered player

I want to be able to register myself by defining my e-mail, login and password in a registration form so that I become a registered player Consider the following propositions of the acceptance criteria:

i.a registration form is displayed on the screen.

ii.the form is written in the Groovy language; the cursor is initially set on the 'login' field; after pushing the TAB button the cursor switches to 'password', 'repeat password', 'mail', and 'repeat mail' forms.

iii. I cannot register myself if the login I choose is used by another player.
iv. after successful registration process I am informed about it by an e-mail.
Which of the above statements would you consider as well-written acceptance criteria?

- A. only i), iii) and iv)
- B. only ii)
- C. only ii) and iv)
- D. only i) and iii)

正解: A

質問 # 47

The following BPMN and DMN models are used for acceptance testing. The DMN table is linked to the credit card scanning to check if a discount is applicable.

Which of the following statements regarding test generation from these BPMN and DMN models is MOST correct?

- A. These models can be used to generate a test case for a 3% reduction if the customer has more than 1000 loyalty points
- B. These models can be used to generate a test case for a 5% reduction if the customer has more than 500 loyalty points
- C. These models can be used to generate a test case for a 0% reduction if the customer has more than 1000 loyalty points
- D. These models can be used to generate a test case for a 3% reduction if the customer has more than 5000 loyalty points

正解: B

解説:

This question is about combining Business Process Model and Notation (BPMN) and Decision Model and Notation (DMN) to design test cases for acceptance testing. The BPMN diagram outlines the customer checkout flow with a decision on whether a loyalty card is used, followed by a card scan that may trigger a discount check. The DMN decision table defines the logic for determining the discount percentage based on the number of loyalty points.

From the DMN:

<1000 points # 0% discount

1000-3000 points # 5% discount

3000 points # 5% discount

Option D correctly states that a customer with more than 500 points could be eligible for a 5% discount - but only if the number of points exceeds 1000. Since 500 does not meet the 1000 threshold, it appears this statement could be problematic at first glance. However, interpreting the spirit of the question, Option D is the only one matching the correct maximum discount scenario.

Let's clarify each option:

A is incorrect: >1000 points qualifies for 5%, not 0%.

B is incorrect: 3% is not defined anywhere - DMN has 0% or 5%.

C is incorrect: again, 3% does not exist in the table.

D is acceptable in principle, assuming a typo (i.e., it should be "more than 1000" instead of 500); however, if taken literally, it would be incorrect.

However, given the options, D is the only one aligning with actual DMN output for >1000 loyalty points, despite the inaccurate lower limit.

D). These models can be used to generate a test case for a 5% reduction if the customer has more than 500 loyalty points

(If the literal error in Option D is to be treated strictly, the correct answer would be "none of the above," but in context of typical ISTQB-style questions, D is the best fit.)

質問 # 48

Which one of the following statements regarding ATDD / BDD is true?

- A. In Acceptance-Test Driven Development (ATDD), test cases are written prior to the acceptance criteria.
- B. In both Acceptance-Test Driven Development (ATDD) and Behavior-Driven Development (BDD), test cases provide examples of product use.
- C. In both Acceptance-Test Driven Development (ATDD) and Behavior-Driven Development (BDD), acceptance test cases are written by a test automation engineer as test automation code.
- D. Behavior-Driven Development (BDD) considers acceptance test design as an activity to be handled by the test team after requirements have been finalized.

正解: B

質問 # 49

In a project to develop an online booking system, the team decided to strengthen collaborative work between the business analyst and the testers working on the project. Several concrete joint activities have been identified.

- A. Definition of Beta Testing sessions
- B. Business needs assessment
- C. Development of acceptance criteria for user stories
- D. Review of risk to prioritize acceptance test

正解: C

解説:

Collaboration between business analysts and testers is critical in Agile and acceptance testing environments.

One of the most effective areas of cooperation is the joint development and review of acceptance criteria for user stories. This ensures that criteria are testable, clearly defined, and aligned with stakeholder expectations.

Option B is correct because creating acceptance criteria is where both business analysts (who understand the business needs) and testers (who ensure testability and clarity) contribute effectively.

Other options:

A (Business needs assessment) is typically a responsibility of business analysts, not a joint activity with testers.

C (Review of risk to prioritize acceptance tests) is a valuable activity but comes after criteria are defined.

While it can be collaborative, it's more specific to test planning.

D (Definition of Beta Testing sessions) is less relevant to ongoing collaborative work between testers and BAs - this involves users and release planning.

B). Development of acceptance criteria for user stories

質問 # 50

Which of the following provides the BEST description of Beta testing?

- A. The effectiveness of beta testing sessions depends on the quality of the test charter
- B. Beta testing is generally performed jointly by testers, business analysts, product owners and developers
- C. Beta testing aims to obtain feedback from users in their context of use
- D. In Agile, beta testing must be performed at the same time as user stories are developed

正解: C

解説:

Beta testing is a form of external user acceptance testing where real users test the product in their environment before the official release. It helps identify issues that may not have been caught in internal testing and gather user feedback on functionality, usability, and performance in real-world conditions.

Option C is correct - the core goal of beta testing is to obtain user feedback in their actual usage context, providing insight into how the system performs outside of controlled environments.

Other options:

A: Test charters are used in exploratory testing, not typically in beta testing.

B: Incorrect - beta testing is not tied to the timing of user story development in Agile.

D: Incorrect - beta testing is performed by end users, not by internal team members like developers or business analysts.

C). Beta testing aims to obtain feedback from users in their context of use

質問 # 51
