If you are preparing for an exam, it may spend lots of time, but don't worry, if you are preparing for the Terraform-Associate-003 exam, the product of our company will help you save your time. The product of our company will list the major key points of the Terraform-Associate-003 exam, and you can grasp the knowledge points as quickly as possible, therefore the time is saving. Besides, the product for Terraform-Associate-003 Exam also provide specific training materials for the exam. And the PDF version is convenient to read, and support printing, while the software version stimulate the real environment of the Terraform-Associate-003 exam. The APP online version is slao available of the product, you can learn at any time and at any place. Choosing our product, it wil help you.

HashiCorp Terraform-Associate-003 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">• Develop and troubleshoot dynamic configuration: This section deals with topics such as using language features to validate configuration query providers using data sources, computing and interpolating data using HCL functions, and using meta-arguments in configuration.
Topic 2	<ul style="list-style-type: none">• Develop collaborative Terraform workflows: In this section, candidates are tested for their skills related to managing the Terraform binary, providers, and modules using version constraints and setting up remote states. It also covers the utilization of the Terraform workflow in automation.
Topic 3	<ul style="list-style-type: none">• Configure and use Terraform providers: In this section, topics covered include understanding Terraform's plugin-based architecture and configuring providers. It also covers aliasing, sourcing, and versioning functions.

100% Pass 2026 HashiCorp Valid Terraform-Associate-003: HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Reliable Test Preparation

As we all know, respect and power is gained through knowledge or skill. The society will never welcome lazy people. Do not satisfy what you have owned. Challenge some fresh and meaningful things, and when you complete Terraform-Associate-003 exam, you will find you have reached a broader place where you have never reach. There must be one that suits you best. Your life will become more meaningful because of your new change, and our Terraform-Associate-003 question torrents will be your first step.

HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Sample Questions (Q153-Q158):

NEW QUESTION # 153

When using a remote backend or terraform Cloud integration, where does Terraform save resource state?

- A. On the disk
- B. In memory
- C. In the remote backend or Terraform Cloud
- D. In an environment variable

Answer: C

Explanation:

Explanation

This is where Terraform saves resource state when using a remote backend or Terraform Cloud integration, as it allows you to store and manage your state file in a remote location, such as a cloud storage service or Terraform Cloud's servers. This enables collaboration, security, and scalability for your Terraform infrastructure.

NEW QUESTION # 154

Which is the best way to specify a tag of v1.0.0 when referencing a module stored in Git (for example.

Git:https://example.com/vpc.git)?

- A. Add version = "1.0.0" parameter to module block
- B. Append **pref=v1.0.0** argument to the source path
- C. Nothing modules stored on GitHub always default to version 1.0.0

Answer: B

Explanation:

The best way to specify a tag of v1.0.0 when referencing a module stored in Git is to append ?ref=v1.

0.0 argument to the source path. This tells Terraform to use a specific Git reference, such as a branch, tag, or commit, when fetching the module source code. For example, source = "git:https://example.com/vpc.git?

ref=v1.0.0". This ensures that the module version is consistent and reproducible across different environments. References = [Module Sources], [Module Versions]

NEW QUESTION # 155

You use a cloud provider account that is shared with other team members. You previously used Terraform to create a load balancer that listens on port 80. After application changes, you updated the Terraform code to change the port to 443.

You run terraform plan and see that the execution plan shows the port changing from 80 to 443 like you intended and step away to grab some coffee.

In the meantime, another team member manually changes the load balancer port to 443 through the cloud provider console before you get back to your desk.

What will happen when you run terraform apply upon returning to your desk?

- A. Terraform will recreate the load balancer.
- B. Terraform will change the load balancer port to 80, and then change it back to 443.
- C. **Terraform will fail with an error because the state file is no longer accurate.**
- D. Terraform will not make any changes to the load balancer and will update the state file to reflect the manual change.

Answer: C

Explanation:

Comprehensive and Detailed in-Depth Explanation:Terraform keeps track of the infrastructure state via the state file. When you initially ran terraform plan, Terraform determined that the port should be changed from 80 to 443. However, since another team member manually modified the load balancer, Terraform's local state file is now outdated.

* When you run terraform apply, Terraform will compare the expected state (from the plan) with the actual state (from the provider API).

* Since the port is already set to 443, but the local state file still shows 80, Terraform will fail with an error due to the state mismatch.

* To resolve this, you should run terraform refresh or use terraform apply -refresh-only to update the local state before applying changes.

NEW QUESTION # 156

terraform validate uses provider APIs to verify your infrastructure settings.

- A. True
- B. False

Answer: B

Explanation:

Comprehensive and Detailed in-Depth Explanation:terraform validateonlychecks the configuration's syntax and internal consistency-it does notinteract with provider APIs or check if the infrastructure settings are correct.

* It ensures that the Terraform code is syntactically correct and follows proper HCL structure.

* However, it doesnotverify if resources are valid according to the provider API or if the credentials are correct.

* To verify actual infrastructure settings, use terraform plan, which interacts with the provider APIs.

NEW QUESTION # 157

Terraform can only manage resource dependencies if you set them explicitly with the depends_on argument.

- A. True
- B. False

Answer: B

Explanation:

Terraform can manage resource dependencies implicitly or explicitly. Implicit dependencies are created when a resource references another resource or data source in its arguments. Terraform can infer the dependency from the reference and create or destroy the resources in the correct order. Explicit dependencies are created when you use the depends_on argument to specify that a resource depends on another resource or module. This is useful when Terraform cannot infer the dependency from the configuration or when you need to create a dependency for some reason outside of Terraform's scope. References = : Create resource dependencies : Terraform Resource Dependencies Explained

NEW QUESTION # 158

.....

Only if you download our software and practice no more than 30 hours will you attend your test confidently. Because our Terraform-Associate-003 exam torrent can simulate limited-timed examination and online error correcting, it just takes less time and energy for you to prepare the Terraform-Associate-003 exam than other study materials. It is very economical that you just spend 20 or 30 hours then you have the Terraform-Associate-003 certificate in your hand, which is typically beneficial for your career in the future. Therefore, purchasing the Terraform-Associate-003 guide torrent is the best and wisest choice for you to prepare your test.
