dbt Labs dbt Analytics Engineering Certification Exam Sample Questions (Q96-Q101):

NEW QUESTION # 96

You want to write a custom test to check for potential anomalies in a time-series dataset. Which of the following would be the MOST important considerations when designing this test?

- A. Ensuring the test integrates seamlessly with dbt's docs feature.
- B. Identifying the metrics (e.g., average, standard deviation) relevant to your data.
- C. Defining thresholds for what constitutes an anomaly in your business context.
- D. Understanding the expected seasonality or patterns in the data.

Answer: B,C,D

Explanation:

The test logic itself depends on a deep understanding of your data and what 'unusual' behavior looks like. Integration with documentation (D) is secondary.

NEW QUESTION # 97

You introduce a set of schema tests on source tables. These tests run successfully, but upon investigation, you find subtle data quality issues are still being missed. What are potential reasons for this?

- A. Schema tests only run once per day by default.
- B. Schema tests shouldn't be relied on for comprehensive data quality assurance.
- C. Schema tests only check basic structure and not the specific content of the data.
- D. There's a bug in dbt's schema test implementation.

Answer: B,C

Explanation:

Schema tests are a good first line of defense but don't replace the need for more nuanced checks that examine the data's actual content.

NEW QUESTION # 98

(Multiple Select)

- A. Anomaly detection platforms.
- B. Tools specializing in schema change detection.
- C. Data integration testing frameworks (e.g., Great Expectations)
- D. Continuous Integration (CI) tools.

Answer: A,B,C

Explanation:

All of these address different aspects of advanced data validation that complement the basic tests within dbt. CI tools (D) are involved in running these checks but are not the data validation tools themselves.

NEW QUESTION # 99

Which of the following scenarios might warrant a git rebase instead of a standard git merge when integrating your changes into the main branch?

- A. You want to avoid a merge commit and keep a linear project history.
- B. Your branch has diverged significantly from the main branch with unrelated changes.
- C. You need to resolve complex merge conflicts that arise during a standard merge.
- D. You only want to include a subset of your feature branch commits in the main branch.

Answer: A,B

Explanation:

A Rebasing creates a more linear history, making it easier to trace changes over time. D. Rebasing allows for a cleaner integration when a feature branch contains intermingled changes that shouldn't all be merged.

NEW QUESTION # 100

(Multiple Select)

- A. The Jinja templating itself introduces a significant processing overhead.
- B. The `fact_orders` table might lack an appropriate index for the `warehouse_code` column.
- C. Dynamically generating column names in a loop is inefficient for most databases.
- D. The nested CASE statement with repeated conditional checks is causing redundant calculations.

Answer: C,D

Explanation:

Dynamic column creations and repeated CASE evaluations often hinder database optimization. Indexes matter too, while Jinja itself is less likely the core bottleneck.

NEW QUESTION # 101
