Cloudera CDP Data Engineer - Certification Exam Sample Questions (Q101-Q106):

NEW QUESTION # 101

When tuning Spark applications, why is it important to adjust the `spark.executor.cores` configuration?

- A. To determine the number of partitions created during shuffle operations
- **B. To specify the number of tasks that can be run in parallel on a single executor**
- C. To directly control the amount of memory available to each executor
- D. To limit the maximum size of Spark's internal data structures

Answer: B

Explanation:

The `spark.executor.cores` configuration specifies the number of cores to use on each executor. By adjusting this value, you control the number of tasks that can run in parallel on a single executor, directly impacting the application's concurrency and overall

performance. Option B is incorrect as this configuration does not control data structure sizes. Option C is misleading, while more cores may imply more parallel tasks and thus potentially more memory usage, it does not directly set the memory allocation. Option D is incorrect because the number of partitions created during shuffle operations is controlled by configurations like `spark.sql.shuffle.partitions`, not by the number of executor cores.

NEW QUESTION # 102

What is a primary consideration when deciding to cache data in a distributed computing environment like Apache Spark?

- A. Caching every dataset regardless of its access frequency
- B. Using disk storage for all cached data to improve fault tolerance
- C. Ensuring data is encrypted before caching
- D. The trade-off between memory usage and computational efficiency

Answer: D

Explanation:

When deciding to cache data in a distributed computing environment like Apache Spark, a primary consideration is the trade-off between memory usage and computational efficiency. Caching can significantly speed up data access for frequently accessed datasets, but it also consumes precious memory resources. Balancing the benefits of reduced computation with the costs of increased memory usage is crucial for optimizing application performance.

NEW QUESTION # 103

When optimizing join operations in a distributed data processing environment, why is it important to co-locate join keys?

- A. To ensure data integrity by preventing data loss during network transmission
- B. To enhance data encryption methods for secure joins
- C. To minimize data shuffle by ensuring related data is on the same node
- D. To increase the storage capacity required for join operations

Answer: C

Explanation:

Co-locating join keys is crucial for minimizing data shuffle during join operations in a distributed data processing environment. By ensuring that related data resides on the same node, the need for moving large amounts of data across the network is reduced, thereby improving the performance and efficiency of join operations.

NEW QUESTION # 104

You want to track changes to an Iceberg table over time for auditing purposes. Which combination of Iceberg features would best support this?

- A. Snapshots and partition evolution
- B. Snapshots and manifest lists
- C. Metadata tables and time travel
- D. Hidden partitioning and Iceberg audit logs

Answer: C

Explanation:

C). The REMOVE ORPHAN FILES procedure is specifically designed to identify and remove files that are no longer referenced in the Iceberg metadata, which often occurs due to corruption.

NEW QUESTION # 105

Which of the following commands is used to install PySpark in your development environment?

- A. `pip install pyspark`
- B. `yarn add pyspark`

- C. npm install pyspark
- D. brew install pyspark

Answer: A

Explanation:

PySpark is a Python library and can be installed using pip, which is the package installer for Python. The correct command is 'pip install pyspark'.
