## Snowflake SnowPro® Core Certification (COF-C03) Sample Questions (Q624-Q629):

### NEW QUESTION # 624

What is a key feature of Snowflake architecture?

- A. Snowflake eliminates resource contention with its virtual warehouse implementation
- B. Software updates are automatically applied on a quarterly basis
- C. Snowflake automatically sorts DATE columns during ingest for fast retrieval by date
- D. Multi-cluster warehouses allow users to run a query that spans across multiple clusters
- E. Zero-copy cloning creates a mirror copy of a database that updates with the original

**Answer: A**

Explanation:

One of the key features of Snowflake's architecture is its unique approach to eliminating resource contention through the use of virtual warehouses. This is achieved by separating storage and compute resources, allowing multiple virtual warehouses to operate independently on the same data without affecting each other. This means that different workloads, such as loading data, running queries, or performing complex analytics, can be processed simultaneously without any performance degradation due to resource contention.

### NEW QUESTION # 625

How does Snowflake handle the bulk unloading of data into single or multiple files?

- A. It uses the put command to download the data by default.
- **B. It assigns each unloaded data file a unique name.**
- C. It uses COPY INTO <location> to copy the data from a table into one or more files in an external stage only.
- D. It uses COPY INTO <location> for bulk unloading where the default option is SINGLE - TRUE.

**Answer: B**

Explanation:

When unloading data, Snowflake assigns each file a unique name to ensure there is no overlap or confusion between files. This is part of the bulk unloading process where data is exported from Snowflake tables into flat files.

### NEW QUESTION # 626

Which role must be used to create resource monitors?

- A. SYSADMIN
- **B. ACCOUNTADMIN**
- C. ORGADMIN
- D. SECURITYADMIN

**Answer: B**

Explanation:

In Snowflake, the ACCOUNTADMIN role is required to create resource monitors. Resource monitors are used to manage and monitor the consumption of compute resources. The ACCOUNTADMIN role has the necessary privileges to create, configure, and manage resource monitors across the account.

### NEW QUESTION # 627

How does Snowflake define its approach to Discretionary Access Control (DAC)?

- A. A defined level of access to an object
- **B. Access privileges are assigned to roles, which are in turn assigned to users.**
- C. An entity in which access can be granted
- D. Each object has an owner, who can in turn grant access to that object.

**Answer: B**

Explanation:

Snowflake implements Discretionary Access Control (DAC) by using a role-based access control model. In this model, access privileges are not directly assigned to individual objects or users but are encapsulated within roles. These roles are then assigned to users, effectively granting them the access privileges contained within the role. This approach allows for granular control over database access, making it easier to manage permissions in a scalable and flexible manner. References: Snowflake Documentation on Access Control

### NEW QUESTION # 628

Which of the following are valid methods for authenticating users for access into Snowflake? (Select THREE)

- A. SCIM

- B. Key-pair authentication
- C. TLS 1.2
- D. OCSP authentication
- E. Federated authentication
- F. OAuth

**Answer: B,E,F**

Explanation:

Snowflake supports several methods for authenticating users, including federated authentication, key-pair authentication, and OAuth. Federated authentication allows users to authenticate using their organization's identity provider. Key-pair authentication uses a public-private key pair for secure login, and OAuth is an open standard for access delegation commonly used for token-based authentication.
