We attract customers by our fabulous Identity-and-Access-Management-Architect certification material and high pass rate, which are the most powerful evidence to show our strength. We are so proud to tell you that according to the statistics from our customers' feedback, the pass rate among our customers who prepared for the exam with our Identity-and-Access-Management-Architect Test Guide have reached as high as 99%, which definitely ranks the top among our peers. Hence one can see that the Salesforce Certified Identity and Access Management Architect learn tool compiled by our company are definitely the best choice for you.

Salesforce Certified Identity and Access Management Architect certification is ideal for individuals who are experienced in Salesforce and have a strong understanding of the platform's security model. Salesforce Certified Identity and Access Management Architect certification validates a candidate's knowledge and skills in designing and implementing identity and access management solutions within Salesforce. Salesforce Certified Identity and Access Management Architect certification is a valuable asset for individuals who are seeking to advance their career in Salesforce and can lead to increased career opportunities.

Salesforce Certified Identity and Access Management Architect Sample Questions (Q100-Q105):

NEW QUESTION # 100

Universal Containers (UC) has built a custom time tracking app for its employee. UC wants to leverage Salesforce Identity to control access to the custom app.

At a minimum, which Salesforce license is required to support this requirement?

- A. Identity Verification
- **B. Identity Only**
- C. Identity Connect
- D. External Identity

Answer: B

Explanation:

To use Salesforce Identity to control access to the custom time tracking app, the identity architect should use the Identity Only license. The Identity Only license is a license type that enables users to access external applications that are integrated with Salesforce using single sign-on (SSO) or delegated authentication, but not access Salesforce objects or data. The other license types are not relevant for this scenario. References:

Identity Only License, User Licenses

NEW QUESTION # 101

An Architect has configured a SAML-based SSO integration between Salesforce and an external Identity provider and is ready to test it. When the Architect attempts to log in to Salesforce using SSO, the Architect receives a SAML error. Which two optimal actions should the Architect take to troubleshoot the issue?

- **A. Paste the SAML Assertion Validator in Salesforce.**
- B. Ensure the Callback URL is correctly set in the Connected Apps settings.
- **C. Use a browser that has an add-on/extension that can inspect SAML.**
- D. Use the browser's Development tools to view the Salesforce page's markup.

Answer: A,C

Explanation:

Explanation

these are the optimal actions to troubleshoot a SAML error. According to the Salesforce documentation¹, you can use the following methods to debug a SAML error:

Use a browser that has an add-on/extension that can inspect SAML. This will allow you to see the SAML request and response messages and identify any issues with the SAML assertion or the SAML response².

Paste the SAML Assertion Validator in Salesforce. This is a tool that helps you validate the last SAML operation on your organization and shows you any errors or warnings with the SAML assertion or the SAML response¹.

Option A is incorrect because the Callback URL is not related to SAML SSO. The Callback URL is used for OAuth SSO, which is a different protocol³. Option D is incorrect because using the browser's Development tools to view the Salesforce page's markup will not help you debug a SAML error. The page's markup does not contain any information about the SAML request or response⁴.

NEW QUESTION # 102

A Salesforce customer is implementing Sales Cloud and a custom pricing application for its call center agents.

An Enterprise single sign-on solution is used to authenticate and sign-in users to all applications. The customer has the following requirements:

1. The development team has decided to use a Canvas app to expose the pricing application to agents.
2. Agents should be able to access the Canvas app without needing to log in to the pricing application.

Which two options should the identity architect consider to provide support for the Canvas app to initiate login for users?

Choose 2 answers

- **A. Enable SAML in the connected app and Security Assertion Markup Language (SAML) Initiation Method as Service**

Provider Initiated.

- B. Enable OAuth settings in the connected app with required OAuth scopes for the pricing application.
- C. Select "Enable as a Canvas Personal App" in the connected app settings.
- **D. Configure the Canvas app as a connected app and set Admin-approved users as pre-authorized.**

Answer: A,D

Explanation:

To allow agents to access the Canvas app without needing to log in to the pricing application, the identity architect should consider two options:

* Configure the Canvas app as a connected app and set Admin-approved users as pre-authorized. A connected app is a framework that enables an external application to integrate with Salesforce using APIs and standard protocols. A Canvas app is a type of connected app that allows an external application to be embedded within Salesforce. By setting Admin-approved users as pre-authorized, the identity architect can control which users can access the Canvas app by assigning profiles or permission sets to the connected app.

* Enable SAML in the connected app and Security Assertion Markup Language (SAML) Initiation Method as Service Provider Initiated. SAML is a protocol that allows users to authenticate and authorize with an external identity provider and access Salesforce resources. By enabling SAML in the connected app, the identity architect can use Salesforce as a service provider (SP) and the pricing application as an identity provider (IdP) for single sign-on (SSO). By setting SAML Initiation Method as Service Provider Initiated, the identity architect can initiate the SSO process from Salesforce and send a SAML request to the pricing application.

NEW QUESTION # 103

Universal containers (UC) does my domain enable in the context of a SAML SSO configuration? Choose 2 answers

- **A. SSO from salesforce1 mobile app.**
- B. Login forensics
- C. App launcher
- **D. Resource deep linking**

Answer: A,D

NEW QUESTION # 104

Universal Container's (UC) identity architect needs to recommend a license type for their new Experience Cloud site that will be used by external partners (delivery providers) for reviewing and updating their accounts, downloading files provided by UC and obtaining scheduled pickup dates from their calendar.

UC is using their Salesforce production org as the identity provider for these users and the expected number of individual users is 2.5 million with 13.5 million unique logins per month.

Which of the following license types should be used to meet the requirement?

- A. Customer Community plus Login License
- B. External Apps License
- **C. Partner Community Login License**
- D. Partner Community License

Answer: C

Explanation:

Partner Community Login License is the best option for UC's use case, as it allows external partners to access Experience Cloud sites and Salesforce data with a pay-per-login model. The other license types are either too expensive or not suitable for partner users. References: Experience Cloud User Licenses, Salesforce Experience Cloud Pricing
