Certification CISSP exam on the first attempt. The demand of the Certified Information Systems Security Professional (CISSP) exam is growing at a rapid pace day by day and almost everyone is planning to pass it so that they can improve themselves for better futures in the Dumps4PDF sector. CISSP has tried its best to make this learning material the most user-friendly so the applicants don't face excessive issues.

ISC Certified Information Systems Security Professional (CISSP) Sample Questions (Q736-Q741):

NEW QUESTION # 736
In IPSec, if the communication mode is gateway-gateway or host-gateway:

- A. Encapsulating Security Payload (ESP) authentication must be used.
- B. Both tunnel and transport mode can be used.
- C. Only tunnel mode can be used.
- D. Only transport mode can be used.

Answer: B

Explanation:
"IPSec can work in one of two modes: transport mode, where the payload of the message is protected, and tunnel mode, where the payload and the routing and header information is protected." Pg 527 Shon Harris: All-in-One CISSP Certification
Not:"Encapsulating Security Payload (ESP) authentication must be used"

"IPSec is not a strict protocol that dictates the type of algorithm, keys, and authentication method to be used, but it is an open, modular framework that provides a lot of flexibility for companies when they choose to use this type of technology. IPSec uses two basic security protocols: Authentication Header (AH) and the Encapsulating Security Payload (ESP). AH is the authenticating protocol, and ESP is an authenticating and encrypting protocol that uses cryptographic mechanisms to provide source authentication, confidentiality, and message integrity." Pg 527 Shon Harris: All-in-One CISSP Certification

NEW QUESTION # 737

Which of the following is the most reliable authentication method for remote access?

- A. Variable callback system
- B. Synchronous token
- C. Combination of callback and caller ID
- D. Fixed callback system

Answer: B

Explanation:
A Synchronous token generates a one-time password that is only valid for a short period of time. Once the password is used it is no longer valid, and it expires if not entered in the acceptable time frame.
The following answers are incorrect:
Variable callback system. Although variable callback systems are more flexible than fixed callback systems, the system assumes the identity of the individual unless two-factor authentication is also implemented. By itself, this method might allow an attacker access as a trusted user.
Fixed callback system. Authentication provides assurance that someone or something is who or what he/it is supposed to be. Callback systems authenticate a person, but anyone can pretend to be that person. They are tied to a specific place and phone number, which can be spoofed by implementing call-forwarding.
Combination of callback and Caller ID. The caller ID and callback functionality provides greater confidence and auditability of the caller's identity. By disconnecting and calling back only authorized phone numbers, the system has a greater confidence in the location of the call. However, unless combined with strong authentication, any individual at the location could obtain access.

NEW QUESTION # 738

For an organization considering two-factor authentication for secure network access, which of the following is MOST secure?

- A. Tokens and passphrase
- B. Smart card and biometrics
- C. Digital certificates and Single Sign-On (SSO)
- D. Challenge response and private key

Answer: B

NEW QUESTION # 739

What are database views used for?

- A. To allow easier access to data in a database.
- B. To restrict user access to data in a database.
- C. To ensure referential integrity.
- D. To provide audit trails.

Answer: B

Explanation:
Through the use of a view we can provide security for the organization restricting users access to certain data or to the real tables containing the information in our database. For example, we can create a view that brings data from 3 tables, only showing 2 of the 4 columns in each. Instead of giving access to the tables that contain the information, we give access to the view, so the user can access this fixed information but does not have privileges over the tables containing it. This provides security.

NEW QUESTION # 740

Which security model introduces access to objects only through programs?

- A. The Bell-LaPadula model
- B. The Clark-Wilson model
- C. The Biba model
- D. The information flow model

Answer: B

Explanation:

In the Clark-Wilson model, the subject no longer has direct access to objects but instead must access them through programs (well-formed transactions). The Clark-Wilson integrity model provides a foundation for specifying and analyzing an integrity policy for a computing system.

The model is primarily concerned with formalizing the notion of information integrity. Information integrity is maintained by preventing corruption of data items in a system due to either error or malicious intent. An integrity policy describes how the data items in the system should be kept valid from one state of the system to the next and specifies the capabilities of various principals in the system. The model defines enforcement rules and certification rules.

Clark-Wilson is more clearly applicable to business and industry processes in which the integrity of the information content is paramount at any level of classification.

Integrity goals of Clark-Wilson model:

Prevent unauthorized users from making modification (Only this one is addressed by the Biba model).

Separation of duties prevents authorized users from making improper modifications.

Well formed transactions: maintain internal and external consistency i.e. it is a series of operations that are carried out to transfer the data from one consistent state to the other.

The following are incorrect answers:

The Biba model is incorrect. The Biba model is concerned with integrity and controls access to objects based on a comparison of the security level of the subject to that of the object.

The Bell-LaPdaula model is incorrect. The Bell-LaPaula model is concerned with confidentiality and controls access to objects based on a comparison of the clearence level of the subject to the classification level of the object.

The information flow model is incorrect. The information flow model uses a lattice where objects are labelled with security classes and information can flow either upward or at the same level. It is similar in framework to the Bell-LaPadula model.
