Zscaler Digital Transformation Administrator Sample Questions (Q102-Q107):

NEW QUESTION # 102

When configuring Zscaler Private Access, what is the function of the Server Group?

- A. Maps Applications to Application Groups
- B. Maps App Connector Groups to Application Segments
- C. Maps Applications to FQDNs
- D. Maps FQDNs to IP Addresses

Answer: D

Explanation:

A Server Group holds the actual backend endpoints - defined by FQDNs (or IPs) and ports - and effectively maps those FQDNs to their IP addresses so ZPA knows which hosts to steer traffic toward.

NEW QUESTION # 103

A user has opened a support case to complain about poor user experience when trying to manage their AWS resources. How could a helpdesk administrator get a useful root cause analysis to help isolate the issue in the least amount of time?

- A. Check the Zscaler Trust page for any indications of cloud outages or incidents that would be causing a slowdown.
- B. Check the user's ZDX score for a period of low score for AWS and use Analyze Score to get the ZDX Y-Engine analysis.
- C. Do a Deep Trace on the user's traffic and check for excessive DNS resolution times and other slowdowns.
- D. Initiate a packet capture from Zscaler Client Connector and escalate the case to have the trace analyzed for root cause.

Answer: D

Explanation:

By reviewing the user's ZDX score for AWS and running "Analyze Score," the Y#Engine automatically correlates metrics (network, client, and application) to pinpoint the root cause, delivering targeted insights far faster than manual tracing or external outage checks.

NEW QUESTION # 104

What happens after the Zscaler Client Connector receives a valid SAML response from the Identity Provider (IdP)?

- A. There is no need for further actions as the SAML is valid, access is granted immediately.
- B. Zscaler Internet Access validates the SAML response and returns an authentication token.
- C. The Zscaler Client Connector Portal authenticates the user directly.
- D. The SAML response is sent back to the user's device for local validation.

Answer: B

Explanation:

After the Zscaler Client Connector (ZCC) receives a valid SAML response, Zscaler Internet Access (ZIA) takes over to validate the SAML assertion. Upon successful validation, ZIA issues an authentication token that allows the user to access services securely. This centralized validation ensures authentication integrity and enables seamless policy enforcement across Zscaler services.

NEW QUESTION # 105

What Malware Protection setting can be selected when setting up a Malware Policy?

- A. Do Not Decrypt
- B. Isolate
- C. Bypass
- D. Block

Answer: D

Explanation:

The valid Malware Protection setting selectable when configuring a Malware Policy in Zscaler is Block. This setting instructs the platform to block malicious files or activities detected by malware scanning engines.

Other settings like Isolate or Bypass are not standard malware policy actions in Zscaler's malware protection configuration. The "Do Not Decrypt" option relates to SSL inspection settings, not malware policy actions.

The study guide specifies "Block" as the primary malware policy action to enforce protection.

NEW QUESTION # 106

Which feature does Zscaler Client Connector Z-Tunnel 2.0 enable over Z-Tunnel 1.0?

- A. Enables Browser Isolation
- B. Enables SSL Inspection for Client Connector
- C. Enables multicast traffic
- **D. Inspection of all ports and protocols via Cloud Firewall**

Answer: D

Explanation:

Z-Tunnel 2.0 upgrades over 1.0 by carrying all ports and protocols through the Cloud Firewall for inspection - rather than being limited to just HTTP/HTTPS - ensuring full visibility and control.

NEW QUESTION # 107
