

Saviynt SCAIP Latest Exam Book: Saviynt Certified Advanced IGA Professional (Level 200) - Dumpexams 100% Pass Rate Offer

Our SCAIP training braindumps are famous for its wonderful advantages. The content is carefully designed for the SCAIP exam, rich question bank and answer to enable you to master all the test knowledge in a short period of time. Our SCAIP Exam Questions have helped a large number of candidates pass the SCAIP exam yet. Hope you can join us, and we work together to create a miracle.

The exam outline will be changed according to the new policy every year, and the SCAIP questions torrent and other teaching software, after the new exam outline, we will change according to the syllabus and the latest developments in theory and practice and revision of the corresponding changes, highly agree with outline. The SCAIP Exam Questions are the perfect form of a complete set of teaching material, teaching outline will outline all the knowledge points covered, comprehensive and no dead angle for the SCAIP candidates presents the proposition scope and trend of each year.

SCAIP Dumps Torrent: Saviynt Certified Advanced IGA Professional (Level 200) & SCAIP Exam Bootcamp

Since our SCAIP study guide have varied versions which contain the PDF, Software and APP online, you can study whenever you are or even offline state according to their different merits. In addition, Our SCAIP training quiz will be very useful for you to improve your learning efficiency, because you can make full use of your all spare time to do test. It will bring a lot of benefits for you beyond your imagination if you buy our SCAIP Study Materials.

Saviynt Certified Advanced IGA Professional (Level 200) Sample Questions (Q53-Q58):

NEW QUESTION # 53

To authenticate Saviynt REST API calls, what must be generated before invoking protected APIs?

- A. SMTP token
- B. Transport package
- C. Dataset key
- D. OAuth access token

Answer: D

Explanation:

The correct answer is B. OAuth access token . Saviynt documentation states that to integrate Saviynt APIs with Saviynt Identity Cloud, an OAuth access token must be generated to authenticate API calls. This is a foundational concept for the API section of Level 200 because even when using Postman or another client, the request must be authenticated before protected endpoints can be called successfully. Saviynt also documents that its APIs are RESTful APIs used to configure and access various platform features, so token-based authentication is central to practical API usage.

The other options are unrelated to Saviynt REST API authentication. SMTP token is not a Saviynt API authentication model, Transport package is used for moving supported configurations between environments, and Dataset key is not the documented authentication requirement for API access. Saviynt's API reference guide further describes version-specific collections, supported methods, requests, and responses, which is exactly why Postman-based testing in certification labs usually starts with authentication setup first. In practical terms, if the OAuth token is missing or invalid, the request will fail even if the endpoint URL and payload are correct. That is why OAuth access token generation is the correct answer.

NEW QUESTION # 54

An EIC Administration has a requirement to configure a separate password policy for service accounts along with the password policy for regular accounts. How can this be achieved in EIC?

- A. Define a separate Password Policy for Service Account and select it in Policy Rule Service Account field under Global Configurations
- B. Define a separate Password Policy for Service Account and select it in Policy Rule Service Account field under Security System
- C. Only one Password Policy can be defined in the Security System which applies to both regular and service accounts
- D. Define a separate Password Policy for Service Account and select the checkbox Password Policy Service Account field under Password Policy configurations

Answer: B

Explanation:

In Saviynt EIC, password management is highly configurable, allowing organizations to define separate password policies for different account types, including service accounts and regular user accounts. This requirement is achieved by creating a dedicated password policy specifically for service accounts and associating it appropriately within the system.

Option A is correct because Saviynt allows administrators to define a separate Password Policy for Service Accounts and map it using the Policy Rule Service Account field under the Security System configuration.

This ensures that when service account operations such as password resets or provisioning occur, the system enforces the correct policy distinct from regular user accounts.

Option B is incorrect since Saviynt supports multiple password policies and does not restrict to a single policy. Option C is incorrect because simply selecting a checkbox in password policy configuration does not link it to service account usage. Option D is incorrect as Global Configurations do not directly assign password policies for service accounts at the execution level.

Thus, configuring and mapping the policy at the Security System level ensures correct enforcement for service accounts.

NEW QUESTION # 55

What are the different authentication modes supported for SMTP configurations? (Multi Select)

- A. OAuth
- B. NTLM
- C. None of the above
- D. Basic

Answer: A,B,D

Explanation:

In Saviynt EIC, SMTP configuration is used to enable email notifications for workflows such as access requests, certifications, alerts, and system communications. To securely connect with mail servers, Saviynt supports multiple authentication mechanisms. The valid authentication modes are NTLM, OAuth, and Basic, making Options A, B, and D correct.

Basic Authentication (Option D) is the traditional method where a username and password are used to authenticate with the SMTP server. While widely supported, it is less secure compared to modern methods and is being phased out in many environments.

NTLM (Option A) is commonly used in Microsoft-based environments (e.g., Exchange servers) and provides integrated authentication using Windows credentials, offering better security than basic authentication.

OAuth (Option B) is a modern and more secure authentication mechanism that uses token-based authorization instead of storing credentials. It is commonly used with cloud-based email services such as Microsoft 365 or Google Workspace.

Option C is incorrect because Saviynt explicitly supports multiple authentication modes.

Thus, NTLM, OAuth, and Basic are the supported SMTP authentication modes in Saviynt.

NEW QUESTION # 56

During a User Import, to define the maximum number of records to be processed in each page, specify the value of the MAX_PAGINATION_SIZE parameter. If this value is not defined, what is the default value?

- A. 0
- B. 1
- C. 2
- D. No default value, it's based on MAX_PAGINATION_SIZE

Answer: B

Explanation:

In Saviynt EIC REST connector configurations, pagination is a critical mechanism used during user import (identity reconciliation) to efficiently process large datasets from target systems. The parameter MAX_PAGINATION_SIZE determines how many records are fetched and processed per API call (per page).

If MAX_PAGINATION_SIZE is not explicitly defined, Saviynt uses a default value of 1000 records per page.

This default is designed to balance performance and system stability. Fetching too many records in a single API call can lead to performance bottlenecks, API timeouts, or memory issues, while too few records can increase the number of API calls and slow down the overall import process.

Option A (50000) and C (10000) are incorrect because these values are typically too large for default settings and must be explicitly configured if required. Option B is incorrect because Saviynt does provide a default fallback value rather than leaving it undefined.

Therefore, when MAX_PAGINATION_SIZE is not specified, Saviynt defaults to 1000, ensuring efficient and stable data import operations.

NEW QUESTION # 57

Which rule type is primarily used to provision birthright access, also known as zero-day provisioning, based on specified conditions?

- A. User Update Rule
- B. Technical Rule
- C. SAV Role
- D. Scan Rule

Answer: B

Explanation:

The correct answer is B. Technical Rule . Saviynt documentation clearly states that a Technical Rule is primarily used to provision birthright access , also referred to as zero-day provisioning , to users joining the organization based on specified conditions. This is one of the most important distinctions in the Rules and Policies section of the Level 200 syllabus. Technical Rules are intended for automated access assignment logic, especially where access must be granted immediately when user attributes match business conditions such as department, location, or cost center.

The other options are not correct for this use case. User Update Rules are generally used to take actions when user records change and can support lifecycle events, but the documentation identifies Technical Rules as the primary mechanism for birthright provisioning. Scan Rules are used for detection and policy-based scanning use cases, not default access assignment. SAV Role controls platform authorization inside Saviynt rather than provisioning target application access. Saviynt also documents that entitlement assignments in a Birthright Rule can be parameterized using user attributes, which reinforces that Technical Rules are the intended framework for this type of zero-day access automation.

NEW QUESTION # 58

.....

You will become accustomed to and familiar with the free demo for Saviynt SCAIP Exam Questions. Exam self-evaluation techniques in our SCAIP desktop-based software include randomized questions and timed tests. These tools assist you in assessing your ability and identifying areas for improvement to pass the Saviynt Saviynt Certified Advanced IGA Professional (Level 200) exam.
