## Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q172-Q177):

### NEW QUESTION # 172

A solutions architect is planning the deployment of a new static website. The solution must minimize costs and provide at least 99% availability. Which solution meets these requirements?

- A. Deploy the application to an Amazon EC2 instance that runs in one AWS Region and one Availability Zone.
- **B. Deploy the application to an Amazon S3 bucket in one AWS Region that has versioning disabled.**
- C. Deploy the application to an Amazon S3 bucket that has versioning and cross-Region replication enabled.
- D. Deploy the application to Amazon EC2 instances that run in two AWS Regions and two Availability Zones.

**Answer: B**

### NEW QUESTION # 173

A company provides an online service for posting video content and transcoding it for use by any mobile platform. The application architecture uses Amazon Elastic File System (Amazon EFS) Standard to collect and store the videos so that multiple Amazon EC2 Linux instances can access the video content for processing. As the popularity of the service has grown over time, the storage costs have become too expensive.

Which storage solution is MOST cost-effective?

- A. Use AWS Storage Gateway for files to store and process the video content
- **B. Use Amazon S3 for storing the video content. Move the files temporarily over to an Amazon Elastic Block Store (Amazon EBS) volume attached to the server for processing.**
- C. Use Amazon EFS for storing the video content. Once processing is complete, transfer the files to Amazon Elastic Block Store (Amazon EBS).
- D. Use AWS Storage Gateway for volumes to store and process the video content.

**Answer: B**

Explanation:

Explanation

\* Amazon S3 for large-scale, durable, and inexpensive storage of the video content. S3 storage costs are significantly lower than EFS. \* Amazon EBS only temporarily during processing. By mounting an EBS volume only when a video needs to be processed, and unmounting it after, the time the content spends on the higher-cost EBS storage is minimized. \* The EBS volume can be sized to match the workload needs for active processing, keeping costs lower. The volume does not need to store the entire video library long-term.

### NEW QUESTION # 174

A company is running a batch analysis every hour on their main transactional DB, running on an RDS MySQL instance to populate their central Data Warehouse running on Redshift. During the execution of the batch, their transactional applications are very slow. When the batch completes, they need to update the top management dashboard with the new data. The dashboard is produced by another system running on-premises that is currently started when a manually-sent email notifies that an update is required. The on-premises system cannot be modified because it is managed by another team.

How would you optimize this scenario to solve performance issues and automate the process as much as possible?

- A. Create an RDS Read Replica for the batch analysis and SQS to send a message to the on-premises system to update the dashboard.
- B. Create an RDS Read Replica for the batch analysis and SNS to notify the on-premises system to update the dashboard.
- **C. Replace RDS with Redshift for the batch analysis and SNS to notify the on-premises system to update the dashboard.**
- D. Replace ROS with Redshift for the batch analysis and SQS to send a message to the on-premises system to update the dashboard.

**Answer: C**

### NEW QUESTION # 175

An application runs on Amazon EC2 instances in private subnets. The application needs to access an Amazon DynamoDB table. What is the MOST secure way to access the table while ensuring that the traffic does not leave the AWS network?

- A. Use a VPC endpoint for DynamoDB.
- **B. Use a NAT instance in a private subnet.**
- C. Use a NAT gateway in a public subnet.
- D. Use the internet gateway attached to the VPC.

**Answer: B**

### NEW QUESTION # 176

A company is storing backup files by using Amazon S3 Standard storage. The files are accessed frequently for 1 month. However, the files are not accessed after 1 month. The company must keep the files indefinitely.

Which storage solution will meet these requirements MOST cost-effectively?

- A. Create an S3 Lifecycle configuration to transition objects from S3 Standard to S3 One Zone-Infrequent Access (S3 One Zone-IA) after 1 month.
- **B. Create an S3 Lifecycle configuration to transition objects from S3 Standard to S3 Glacier Deep Archive after 1 month.**
- C. Create an S3 Lifecycle configuration to transition objects from S3 Standard to S3 Standard-Infrequent Access (S3 Standard-IA) after 1 month.
- D. Configure S3 Intelligent-Tiering to automatically migrate objects.

**Answer: B**

Explanation:

The storage solution that will meet these requirements most cost-effectively is B: Create an S3 Lifecycle configuration to transition objects from S3 Standard to S3 Glacier Deep Archive after 1 month. Amazon S3 Glacier Deep Archive is a secure, durable, and extremely low-cost Amazon S3 storage class for long-term retention of data that is rarely accessed and for which retrieval times of several hours are acceptable. It is the lowest-cost storage option in Amazon S3, making it a cost-effective choice for storing backup files that are not accessed after 1 month. You can use an S3 Lifecycle configuration to automatically transition objects from S3 Standard to S3 Glacier Deep Archive after 1 month. This will minimize the storage costs for the backup files that are not accessed frequently.
