An administrator is troubleshooting an issue when a high-availability (HA) failover occurs.
Which conclusion can you draw from the debug output?

- A. The HA cluster is deployed using the software-defined network (SDN) connector.
- B. The health check has successfully updated the internal custom route to forward all internal traffic to 172.16.1.3.
- C. The HA cluster is accessible using HTTPS on 34.68.13.24 and 34.66.4.139.
- D. Both cluster members are located in the same zone.

Answer: B

Explanation:
The debug output shows the internal route being updated and moved to the new next hop (172.16.1.3), indicating the health check and failover process successfully redirected internal traffic to the active HA node.

NEW QUESTION # 16
Refer to the exhibit.

An organization has four virtual private cloud networks and deployed a FortiGate to protect the VPCs.
FortiGate is configured with four network interfaces and each network interface is assigned one of the four VPCs.
The organization is expanding and plans to add two more VPCs.
Which two options can the organization use to support the two new VPCs? (Choose two.)

- A. Utilizing VPC peering
- B. Modifying the FortiGate configuration to add two more network interfaces
- C. Adding a second FortiGate and configuring both FortiGate devices as an active-active high-availability cluster.
- D. Deleting FortiGate and replacing it with a Google Cloud machine type that supports six network interfaces

Answer: A,C

Explanation:
VPC peering allows connectivity between multiple VPCs without needing additional interfaces on FortiGate, enabling the existing FortiGate to protect multiple VPCs beyond its physical interface limits.
Adding a second FortiGate and configuring active-active HA enables scaling network protection for more VPCs by distributing traffic across multiple FortiGate instances, overcoming the network interface limit per VM.

NEW QUESTION # 17
Google Cloud network services offer vast functionality and inter-connectivity between the cloud and on- premises networks.
Which three additional functions does FortiGate offer when deployed in Google Cloud to complement the native services offered by Google Cloud? (Choose three.)

- A. OSPF over IPSec
- B. SSL VPN
- C. SSL inspection
- D. Web filtering
- E. Secure SD-WAN with application visibility

Answer: B,C,E

Explanation:
FortiGate provides SSL VPN capabilities for secure remote access.
It offers SSL inspection to decrypt and inspect encrypted traffic for threats.
FortiGate supports Secure SD-WAN with deep application visibility and control, enhancing network performance and security beyond native Google Cloud services.

NEW QUESTION # 18
You are tasked with deploying a load balancer in Google Cloud that does not terminate sessions arriving from outside the VPC and that forwards traffic to the organization's internal web servers.
Which load balancer type should you deploy?

- A. Internal passthrough load balancer
- B. External application load balancer
- C. Proxy network load balancer
- D. External passthrough load balancer

Answer: D

Explanation:
An external passthrough load balancer forwards traffic without terminating sessions, preserving the original client connection, which is ideal for forwarding traffic directly to internal web servers.

NEW QUESTION # 19
You have been tasked with deploying an active-active FortiGate high-availability cluster in Google Cloud.
How can you ensure that traffic will flow symmetrically?

- A. Enable the layer 3 unified threat management scanning feature on FortiGate.

- B. There is no need to ensure traffic symmetry because FortiGate can effectively inspect asymmetric traffic.
- C. Deploy internal passthrough network load balancers on both sides of the cluster they support symmetric hashing.
- D. Google Cloud performs NAT on incoming traffic for external passthrough network load balancers. No action is needed.

Answer: C
