최근 IT 업종에 종사하는 분들이 점점 늘어가는 추세하에 경쟁이 점점 치열해지고 있습니다. IT인증시험은 국제에서 인정받는 효력있는 자격증을 취득하는 과정으로서 널리 알려져 있습니다. Pass4Test의 Salesforce인증 B2B-Commerce-Developer덤프는IT인증시험의 한 과목인 Salesforce인증 B2B-Commerce-Developer시험에 대비하여 만들어진 시험전 공부자료인데 높은 시험적중율과 친근한 가격으로 많은 사랑을 받고 있습니다.

Salesforce B2B-Commerce-Developer 시험요강:

주제	소개
주제 1	Checkout Flow Development: In this topic, Salesforce developers learn how to customize existing checkout flows to meet common customer needs and ensure an optimal storefront experience. Moreover, the topic explains how modifying these flows can streamline user journeys during checkout. Lastly, this topic provides knowledge about the methods and tools necessary to optimize these processes for a seamless payment experience.
주제 2	Reference Implementations: In this topic, candidates gain insight into the four critical reference implementations used in checkout and payment interfaces. Moreover, the topic explains each supported action in-depth, helping developers apply proper code solutions.
주제 3	Error Handling and Diagnostics: This section explores methods for troubleshooting the B2B Commerce system using various diagnostic tools. Moreover, the topic explains how to identify, resolve, and prevent common errors to ensure system stability. This topic also provides practical knowledge to maintain the health and reliability of the B2B Commerce environment for optimal performance.

최신 Salesforce Developer B2B-Commerce-Developer 무료샘플문제 (Q62-

Q67):

질문 # 62

A developer is trying to integrate a new shipping provider to use during checkout in a storefront. Which two steps must the developer take to make an integration available for selection?

- A. Create a `RegisteredExternalService` record using Workbench.
- B. Create an Apex class that uses the integration framework.
- C. Modify the `StoreIntegratedService` to map to an Apex class ID using Workbench.
- D. Enter the integration class name and version in the store administration.

정답: A,B

설명:

To make an integration available for selection, a developer must create a `RegisteredExternalService` record using Workbench and create an Apex class that uses the integration framework. Creating a `RegisteredExternalService` record using Workbench allows the developer to register their custom integration class as an external service in Salesforce B2B Commerce. The `RegisteredExternalService` record contains information such as the class name, version, display name, description, and category of the integration class. The category determines where and how the integration class can be used in B2B Commerce, such as `ShippingService` or `TaxService`. Creating an Apex class that uses the integration framework allows the developer to define custom logic for integrating with an external service provider's API or service. The integration framework provides interfaces and classes for various types of integrations, such as shipping, tax, payment, inventory, and freight. The developer can implement these interfaces and classes in their custom Apex class and override their methods with their own logic. Modifying the `StoreIntegratedService` to map to an Apex class ID using Workbench is not a required step for making an integration available for selection, as it is only used for registering internal services that are provided by Salesforce B2B Commerce out-of-the-box. Entering the integration class name and version in store administration is not a required step either, as it is only used for selecting an existing integration class that has already been registered as an external service. Salesforce Reference: [B2B Commerce Developer Guide: Integration Framework], [B2B Commerce Developer Guide: `RegisteredExternalService` Object]

질문 # 63

Which orders can a user view on Order List Component (Aura) for B2B stores?

- A. Orders placed in any storefront and related to the current effective account
- B. Orders placed in any storefront and related to the current user's account
- C. Orders placed in the current storefront and related to the current user's account
- D. Orders placed in the current storefront and related to the current effective account

정답: D

설명:

Explanation

According to the B2B Commerce Developer Guide, the Order List Component (Aura) for B2B stores displays a list of orders that the user can view and reorder. The component filters the orders based on the current storefront and the current effective account. The current effective account is the account that the user is currently acting on behalf of, which can be different from the user's own account. The component does not show orders placed in other storefronts or related to other accounts, even if the user has access to them.

Therefore, the correct answer is A. Orders placed in the current storefront and related to the current effective account. The other options are incorrect because they do not match the criteria of the component. References: B2B Commerce Developer Guide, Show the Order List Widget

질문 # 64

A user wants to have a customized experience for adding items to the cart. The user also wants the mini cart module to reflect changes to the state of the cart afterwards. How should this requirement be fulfilled?

- A. Trigger the global "cartChange" event after the Add to Cart Action on the custom button.
- B. Leverage the Addto Cart Global API which add items to the cart and also refreshes the page with the new data.
- C. Trigger the global "cartChange" event and then trigger "changeMiniCart" event after the Add to Cart Action on the custom button.
- D. Write a custom Remote Action to refresh the Mini Cart and refresh the Cart Line item count on the Cart Link in the

header.

정답: A

설명:

To have a customized experience for adding items to the cart and also update the mini cart module, the requirement can be fulfilled by triggering the global "cartChange" event after the Add to Cart Action on the custom button. This event will notify all the components that are listening to it that the cart has changed and they should refresh their data accordingly. The mini cart module is one of these components, so it will update its state based on the new cart data. Salesforce References: B2B Commerce and D2C Commerce Developer Guide, Events

질문 # 65

Northern Trail Outfitters (NTO) wants to be able to reference historical data in another system from the Salesforce user experience as read-only, but does not want to import the data into the org or incur storage costs. What is one product feature that could accomplish this?

- A. External SOQL queries in Apex code
- **B. External Objects**
- C. Big Objects
- D. Lightning Out

정답: B

설명:

* The correct answer is External Objects. External objects are similar to custom objects, except that they map to data that's stored outside your Salesforce org12. You can use external objects to access data in real time via web service callouts, without copying the data into your org12. External objects are read-only by default, but you can enable write operations for some data sources12.

* Big Objects are not the correct answer. Big objects allow you to store and manage massive amounts of data on the Salesforce platform. However, big objects are not suitable for referencing historical data in another system, as they require importing the data into the org and incur storage costs.

* Lightning Out is not the correct answer. Lightning Out is a feature that lets you run Lightning components in any container outside the Salesforce platform. However, Lightning Out does not provide a way to reference historical data in another system, as it is mainly used for embedding Lightning components in other web pages or apps.

* External SOQL queries in Apex code are not the correct answer. External SOQL queries are a way to query data from external data sources using SOQL syntax in Apex code. However, external SOQL queries require defining an external data source and an external object first, so they are not a product feature by themselves, but rather a way to use external objects in Apex code.

질문 # 66

A developer is working on an existing checkout implementation built against the Lightning Web Runtime (LWR) and wants to implement a custom child checkout component to modify out-of-the-box functionality. Which interface must the developer implement for the child component?

- A. CustomCheckout
- B. Checkoutoutinterface
- **C. CheckoutStep**
- D. CheckoutSavable

정답: C

Explanation

The other options are not correct because:

* C. CustomCheckout is not a valid interface for a custom child checkout component. There is no such interface in the commerce/checkout module or the Lightning web component framework.

* Create a Custom Checkout Component for a B2B or B2C Store (LWR)

* UseCheckoutComponent Interface
