## NCLEX NCLEX-RN Certification Dumps & New NCLEX-RN Test Voucher

The contents of NCLEX-RN study guide are selected by experts which are appropriate for your practice in day-to-day life. It is especially advantageous for busy workers who lack of sufficient time to use for passing the NCLEX-RN preparation materials. I guess no person can know the NCLEX-RN Exam Questions better than our experts. And we are ready to help you pass NCLEX-RN exam with our high-efficient exam materials by your first attempt.

## NCLEX National Council Licensure Examination(NCLEX-RN) Sample Questions (Q645-Q650):

### NEW QUESTION # 645

A pregnant client comes to the office for her first prenatal examination at 10 weeks. She has been pregnant twice before; the first delivery produced a viable baby girl at 39 weeks 3 years ago; the second pregnancy produced a viable baby boy at 36 weeks 2 years ago. Both children are living and well. Using the gravida and para system to record the client's obstetrical history, the nurse should record:

- A. Gravida 2 para 1
- B. Gravida 3 para 1
- C. Gravida 2 para 2
- **D. Gravida 3 para 2**

**Answer: D**

Explanation:

Explanation

(A) This answer is an incorrect application of gravida and para. The client has had two prior deliveries of more than 20 weeks' gestation; therefore, para equals 2, not 1. (B) This answer is the correct application of gravida and para. The client is currently pregnant for the third time (G = 3), regardless of the length of the pregnancy, and has had two prior pregnancies with birth after the 20th week (P = 2), whether infant was alive or dead. (C) This answer is an incorrect application of gravida and para. The client is currently pregnant for the third time (G = 3, not 2); prior pregnancies lasted longer than 20 weeks (therefore, P = 2, not 1). (D) This is an incorrect application of gravida and para. Client is currently pregnant for third time (G = 3, not 2).

### NEW QUESTION # 646

A 2-day-old infant boy has been diagnosed with an atrial septal defect due to a persistent patent foramen ovale. When explaining the diagnosis to the mother, the nurse includes in the discussion the function of the foramen ovale. In fetal circulation, the foramen ovale allows a portion of the blood to bypass the:

- A. Left ventricle
- **B. Pulmonary system**
- C. Superior vena cava
- D. Liver

**Answer: B**

Explanation:

Explanation/Reference:

Explanation:

(A) The foramen ovale permits a percentage of the blood to shunt from the right atrium to the left atrium. The blood then goes to the left ventricle, permitting systemic fetal circulation with blood containing a higher O<sub>2</sub> saturation. (B) As the blood shunts from the right atrium to the left atrium, the pulmonary system is bypassed. The fetus receives O<sub>2</sub> from the maternal circulation, thereby permitting the partial bypass of the pulmonary system. (C) The foramen ovale is located in the atrial septum of the heart and does not affect the liver. (D) The superior vena cava returns blood to the heart, bringing blood to the location of the foramen ovale.

### NEW QUESTION # 647

A client's renal calculi are identified as consisting of calcium phosphate. Which of the following diets would be appropriate?

- A. Low calcium, high phosphorus
- B. High calcium, low phosphorus
- C. Two-gram sodium diet
- **D. Low calcium and phosphorus, acid ash**

**Answer: D**

Explanation:

Section: Questions Set D

Explanation:

(A) The stones consist of calcium and phosphorus; therefore, these minerals should be avoided. A high- calcium diet is contraindicated. (B) A high-phosphorus diet is contraindicated. (C) A 2-g sodium diet is a cardiac diet. (D) A low-calcium and phosphorus diet will reduce further calculi formation.

#### NEW QUESTION # 648

A client decided early in her pregnancy to breast-feed her first baby. She gave birth to a normal, full-term girl and is now progressing toward the establishment of successful lactation. To remove the baby from her breast, she should be instructed to:

- A. Gently pull the infant away
- B. Withdraw the breast from the infant's mouth
- C. Compress the areolar tissue until the infant drops the nipple from her mouth
- **D. Insert a clean finger into the baby's mouth beside the nipple**

**Answer: D**

Explanation:

(A) In pulling the infant away from the breast without breaking suction, nipple trauma is likely to occur. (B) In pulling the breast away from the infant without breaking suction, nipple trauma is likely to occur. (C) Compressing the maternal tissue does not break the suction of the infant on the breast and can cause nipple trauma. (D) By inserting a finger into the infant's mouth beside the nipple, the lactating mother can break the suction and the nipple can be removed without trauma.

#### NEW QUESTION # 649

A 35-year-old client has returned to her room following surgery on her right femur. She has an IV of D5 in one- half normal saline infusing at 125 mL/hr and is receiving morphine sulfate 10-15 mg IM q4h prn for pain. She last voided 5 1/2 hours ago when she was given her preoperative medication. In monitoring and promoting return of urinary function after surgery, the nurse would:

- **A. Report to the surgeon if the client is unable to void within 8 hours of surgery**
- B. Provide food and fluids at the client's request
- C. Maintain IV, increasing the rate hourly until the client voids
- D. Hold morphine sulfate injections for pain until the client voids, explaining to her that morphine sulfate can cause urinary retention

**Answer: A**

Explanation:

Section: Questions Set G

Explanation:

(A) Provision of food and fluid promotes bowel elimination. Nutritional needs postoperatively are determined by the physician, not the client. (B) Increasing IV fluids postoperatively will not cause a client to void. Any change in rate of administration of IV fluids should be determined by the physician. (C) The postoperative client with normal kidney function who cannot void 8 hours after surgery is retaining urine. The client may need catheterization or medication. The physician must provide orders for both as necessary. (D) Although morphine sulfate can cause urinary retention, withholding pain medication will not ensure that the client will void. The client with uncontrolled pain will probably not be able to void.

#### NEW QUESTION # 650

.....

Our NCLEX-RN study materials combine the key information about the test in the past years' test papers and the latest emerging knowledge points among the industry to help the clients both solidify the foundation and advance with the times.
