Question Identity-and-Access-Management-Architect Explanations & Identity-and-Access-Management-Architect Best Practice

Are you still hesitating about which kind of Identity-and-Access-Management-Architect exam torrent should you choose to prepare for the exam in order to get the related certification at ease? I am glad to introduce our Identity-and-Access-Management-Architect study materials to you. Our company has already become a famous brand all over the world in this field since we have engaged in compiling the Identity-and-Access-Management-Architect practice materials for more than ten years and have got a fruitful outcome. In order to let you have a general idea about our Identity-and-Access-Management-Architect training materials, we have

prepared the free demo in our website for you to download.

Salesforce Identity-and-Access-Management-Architect Exam is a certification exam designed for professionals who specialize in identity and access management in Salesforce. Salesforce Certified Identity and Access Management Architect certification is aimed at individuals who possess a deep understanding of the Salesforce platform and are able to design and implement complex identity and access management solutions for their clients. Identity-and-Access-Management-Architect Exam is one of the most sought-after certifications in the Salesforce ecosystem and is recognized as a benchmark for expertise in identity and access management.

Salesforce Certified Identity and Access Management Architect Sample Questions (Q51-Q56):

NEW QUESTION # 51

Universal Containers is implementing a new Experience Cloud site and the identity architect wants to use dynamic branding features as part of the login process.

Which two options should the identity architect recommend to support dynamic branding for the site?

Choose 2 answers

- A. To use dynamic branding, the community must be built with the Audience + Salesforce Tabs template.
- **B. Do use dynamic branding, the community must be built with the Customer Account Portal template.**
- C. An external content management system (CMS) must be used for dynamic branding on Experience Cloud sites.
- **D. An experience ID (expid) or placeholder parameter must be used in the URL to represent the brand.**

Answer: B,D

Explanation:

Dynamic branding in Experience Cloud relies on the Experience ID, sometimes carried as the expid parameter or equivalent placeholder in the URL, so Salesforce can render the right login experience for the selected brand. This is the scalable way to vary the look and feel without duplicating entire identity stacks. The community template choice can matter because not every template exposes branding capabilities the same way, but the central concept is still the Experience ID. External CMS tools are not required just to route the login experience by brand. From an architecture standpoint, this keeps the login framework centralized while letting the entry experience adapt to whichever brand, campaign, or sub-experience the user selected before authentication. This is why options B, D work together as the correct solution.

NEW QUESTION # 52

Universal containers want to build a custom mobile app connecting to salesforce using OAuth, and would like to restrict the types of resources mobile users can access. What OAuth feature of Salesforce should be used to achieve the goal?

- A. Refresh Tokens
- B. Access Tokens
- C. Mobile pins
- **D. Scopes**

Answer: D

Explanation:

The OAuth feature of Salesforce that should be used to restrict the types of resources mobile users can access is scopes. Scopes are parameters that specify the level of access that the mobile app requests from Salesforce when it obtains an OAuth token. Scopes can be used to limit the access to certain resources or actions, such as API calls, full access, web access, or refresh token. By configuring scopes in the connected app settings, Universal Containers can control what the mobile app can do with the OAuth token and protect against unauthorized or excessive access.

References: [OAuth Scopes], [Connected Apps], [OAuth Authorization Flows]

NEW QUESTION # 53

A multinational company using the Salesforce platform wants to implement robust user activity verification capabilities to detect unauthorized access and unusual login patterns.

They need real-time monitoring and alerting functionalities to respond promptly to security incidents.

Which Salesforce tool should be utilized to achieve these requirements?

- A. Salesforce Platform Encryption

- B. Salesforce Profiles
- C. Salesforce Data Loader
- **D. Salesforce Event Monitoring and Event Log Files**

Answer: D

Explanation:

For real-time visibility into login events and other security-relevant user activity, Salesforce Event Monitoring is the purpose-built monitoring feature. Event Monitoring and Event Log Files give security and identity teams access to detailed telemetry about login behavior, session activity, API usage, and other actions that matter for threat detection and investigation. Profiles and encryption settings do not provide operational monitoring, and Data Loader is unrelated. The architectural distinction is between preventive controls and detective controls. Event Monitoring is a detective control: it helps the organization observe behavior, identify anomalies, and react quickly. When the requirement mentions unusual login patterns, security incidents, or real-time monitoring, Salesforce documentation points architects toward Event Monitoring rather than ordinary administrative setup screens. This is why option A is the best answer in Salesforce terms.

NEW QUESTION # 54

In an SP-Initiated SAML SSO setup where the user tries to access a resource on the Service Provider, What HTTP param should be used when submitting a SAML Request to the IdP to ensure the user is returned to the intended resource after authentication?

- A. DisplayState
- B. StartURL
- **C. RelayState**
- D. RedirectURL

Answer: C

Explanation:

The HTTP parameter that should be used when submitting a SAML request to the IdP to ensure the user is returned to the intended resource after authentication is RelayState. RelayState is an optional parameter that can be used to preserve some state information across the SSO process. For example, RelayState can be used to specify the URL of the resource that the user originally requested on the SP before being redirected to the IdP for authentication. After the IdP validates the user's identity and sends back a SAML response, it also sends back the RelayState parameter with the same value as it received from the SP. The SP then uses the RelayState value to redirect the user to the intended resource after validating the SAML response. The other options are not valid HTTP parameters for this purpose. RedirectURL, DisplayState, and StartURL are not standard SAML parameters and they are not supported by Salesforce as SP or IdP. References: [SAML SSO Flows], [RelayState Parameter]

NEW QUESTION # 55

Universal Containers (UC) would like to enable self-registration for their Salesforce Partner Community Users. UC wants to capture some custom data elements from the partner user, and based on these data elements, wants to assign the appropriate Profile and Account values.

Which two actions should the Architect recommend to UC1

Choose 2 answers

- A. Modify the SelfRegistration trigger to assign Profile and Account.
- **B. Modify the CommunitiesSelfRegController to assign the Profile and Account.**
- **C. Configure Registration for Communities to use a custom Apex Controller.**
- D. Configure Registration for Communities to use a custom Visualforce Page.

Answer: B,C

Explanation:

Explanation

To enable self-registration for partner community users, UC should modify the CommunitiesSelfRegController class to assign the Profile and Account values based on the custom data elements captured from the partner user. UC should also configure Registration for Communities to use a custom Apex controller that extends the CommunitiesSelfRegController class and overrides the default registration logic.
