

# FlashArray-Implementation-Specialist PDF Questions - Latest FlashArray-Implementation-Specialist Dumps

What's more, part of that PassLeaderVCE FlashArray-Implementation-Specialist dumps now are free:

<https://drive.google.com/open?id=1H9hMTA113UE-BdPqJQZ29YJWZlCevgt>

The pass rate for FlashArray-Implementation-Specialist study guide materials is 99%, and if you choose us, we can ensure you that you will pass the exam successfully. You can also enjoy free update for one year if you buy FlashArray-Implementation-Specialist study materials from us, and the update version will be sent to your email automatically, therefore in the following year, you can get the free update version without spending money. Besides, our technicians will check the website constantly to ensure you have a good online shopping environment while buying FlashArray-Implementation-Specialist Exam Dumps from us.

## Pure Storage FlashArray-Implementation-Specialist Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> <li>Installation: This section of the exam measures the skills of Enterprise Infrastructure Technicians and focuses on executing a successful installation of FlashArray systems. It tests the ability to perform physical setup, cabling, configuration of network settings, and the application of initial system configurations necessary for full deployment.</li> </ul>
Topic 2	<ul style="list-style-type: none"> <li>Upgrades: This section of the exam measures the skills of FlashArray Implementation Specialists and focuses on tasks involved in managing firmware and software upgrades. Candidates must demonstrate knowledge of upgrade planning, verification steps, and rollback procedures, ensuring that systems are updated with minimal disruption to service.</li> </ul>
Topic 3	<ul style="list-style-type: none"> <li>Post-Installation</li> <li>Upgrade: This section of the exam measures the skills of FlashArray Implementation Specialists and evaluates how professionals confirm system functionality after installation or an upgrade. It involves validating connectivity, running health checks, confirming configurations, and ensuring that the deployment meets operational expectations.</li> </ul>
Topic 4	<ul style="list-style-type: none"> <li>Pre-Installation</li> <li>Upgrade: This section of the exam measures the skills of Enterprise Infrastructure Technicians and covers all preparation activities before deploying or upgrading a Pure Storage FlashArray. It includes understanding environmental requirements, verifying prerequisites, checking compatibility, and validating system readiness through appropriate tools and documentation.</li> </ul>

## Latest FlashArray-Implementation-Specialist Dumps & High FlashArray-Implementation-Specialist Quality

We always try to find ways to accelerate our customers' professional ability and offer the best quality of FlashArray-Implementation-Specialist dumps pdf among dumps vendors. So we decided to create the FlashArray-Implementation-Specialist real dumps based on the requirement of the certification center and cover the most knowledge points of FlashArray-Implementation-Specialist Practice Test. Our study guide will be your first choice as your exam preparation materials.

### Pure Storage Certified FlashArray Implementation Specialist Sample Questions (Q213-Q218):

#### NEW QUESTION # 213

At the completion of an upgrade, which command is used to send phonehome logs?

- A. purearray phonehome --send-today
- B. purearray phonehome --send-logs
- C. purelogs --send-all

**Answer: A**

Explanation:

At the completion of an upgrade, the correct command to manually trigger the upload of the relevant logs is purearray phonehome --send-today.

Purpose: This specific argument (--send-today) instructs the array to bundle and upload all log files generated within the current 24-hour window. This is the standard procedure post-upgrade because it ensures that all logs capturing the pre-upgrade state, the upgrade process itself, and the immediate post-upgrade health checks are transmitted to Pure Support.

Verification: This allows the Support team to validate that the upgrade completed successfully and that no dormant issues were triggered during the controller failovers.

Syntax: Option A (purelogs) is not a valid command. Option B (--send-logs) is a generic approximation, but the specific "today" flag is the best practice command cited in upgrade checklists to avoid uploading gigabytes of historical data irrelevant to the immediate event.

#### NEW QUESTION # 214

An Implementation Engineer runs check start validate-array-health before starting a FlashArray//X70R3 to FlashArray//X70R5 HWNDU and receives code 60 alert indicating an unhealthy NVRAM module in CH0.NVB1. What action Should the Implementation Engineer take to resolve this?

- A. Proceed with the HWNDU, the //X70 model has a four NVRAM configuration so the array still has redundancy.
- B. Disable the unhealthy NVRAM module and proceed With HWNDU after confirming there is no degraded data.
- C. Reseat the unhealthy NVRAM module, and then verify it is in a healthy status prior to proceeding with the HWNDU.

**Answer: C**

Explanation:

Hardware Non-Disruptive Upgrades (HWNDU) rely strictly on the array being in a fully healthy state before the process begins.

The validate-array-health check is designed to gate the upgrade if any component that provides redundancy or data integrity is compromised. NVRAM (Non-Volatile Random Access Memory) modules are critical components in the FlashArray architecture; they store in-flight write data to ensure it is persistent before being destaged to flash.

A "Code 60" alert specifically points to a hardware issue with an NVRAM module. While the //X70 model indeed has redundancy (often using multiple NVRAM modules), proceeding with an upgrade while one is degraded puts the array at risk. During an NDU, controllers reboot and failover; running on reduced redundancy during these critical operations is not supported and is blocked by the health checks.

The correct first step for an Implementation Engineer is to attempt to reseat the unhealthy NVRAM module. Often, connection issues or transient seating faults can trigger these alerts. After reseating, the engineer must run the health check again to confirm the module status has returned to "healthy." If the module remains unhealthy after reseating, it must be replaced before the upgrade can proceed. You cannot simply disable it or ignore it, as the upgrade script will likely refuse to continue to protect data integrity.

---

### NEW QUESTION # 215

Refer to the following output:

Ping successful with CCM

What does this indicate?

- A. Cross-controller link has successfully connected between controllers
- B. Controller has successfully connected to the Fusion Fleet Coordinator
- **C. Controller has successfully connected to pure1**

**Answer: C**

Explanation:

The output "Ping successful with CCM" is a specific success message returned by the pure support test or pure array test connectivity checks. CCM stands for Cloud Connection Manager, which is the internal service or endpoint responsible for mediating the secure connection between the local FlashArray and the Pure1 cloud management platform.

When an Implementation Engineer sees this message, it confirms that the array can successfully resolve and reach the Pure1 infrastructure over the internet (specifically the pure1.purestorage.com or associated regional endpoints). This validates that: DNS is functioning correctly (resolving the CCM hostname).

Firewall rules are permitting outbound HTTPS (port 443) traffic.

The array's management interface is routing correctly.

This connection is vital for "Phone Home" logs, Remote Assist sessions, and fleet management via the Pure1 mobile app or dashboard. It is distinct from the Fusion Fleet Coordinator (which manages fleet logic) and the cross-controller interconnect (which is internal hardware communication).

---

### NEW QUESTION # 216

On a FlashArray//XR4, which port is enabled for the management service by default?

- A. ETH4
- **B. ETH0**
- C. ETH2

**Answer: B**

Explanation:

Consistent with previous FlashArray generations, the FlashArray//XR4 adheres to the standard port designation for administrative connectivity.

ETH0 is the primary port enabled for the management service by default.

When an Implementation Engineer first connects to a new //XR4 controller to perform the initial IP configuration, they utilize ETH0 (and often ETH1 for redundancy).

These ports are physically labeled for management and are logically separated from the data and replication traffic in the default configuration.

ETH2 and ETH3 are typically reserved or defaulted for replication traffic, while higher-numbered ports (like ETH10+) are used for host I/O or backend shelf connectivity on the R4 platform. Using ETH0 ensures immediate access to the Purity GUI and CLI without requiring custom port reconfiguration.

### NEW QUESTION # 217

Before installing array rails, where should the cage nuts be placed?

- **A. Lowest square of lowest RU**
- B. Lowest square of top RU
- C. Top square of the lowest RU

**Answer: A**

Explanation:

Cage nuts should be placed in the lowest square hole of the lowest rack unit (RU) where the array rails will be installed to ensure proper alignment and support.

## NEW QUESTION # 218

.....

Our FlashArray-Implementation-Specialist exam questions are totally revised and updated according to the changes in the syllabus and the latest developments in theory and practice. We carefully prepare the FlashArray-Implementation-Specialist test guide for the purpose of providing high-quality products. All the revision and updating of products can graduate the accurate information about the FlashArray-Implementation-Specialist Guide Torrent you will get, let the large majority of student be easy to master and simplify the content of important information. Our product FlashArray-Implementation-Specialist test guide delivers more important information with fewer questions and answers.
