### CompTIA SecurityX Certification Exam Sample Questions (Q128-Q133):

#### NEW QUESTION # 128

A security architect must make sure that the least number of services as possible is exposed in order to limit an adversary's ability to access the systems. Which of the following should the architect do first?

- A. Limit access to the systems.
- B. Enforce Secure Boot.
- C. Disable third-party integrations.
- D. Perform attack surface reduction.

**Answer: D**

Explanation:

Attack surface reduction focuses on minimizing unnecessary services, open ports, and vulnerabilities, reducing the exposure to potential adversaries. This aligns with zero trust and least privilege principles.

#### NEW QUESTION # 129

Company A acquired Company B and needs to determine how the acquisition will impact the attack surface of the organization as a whole. Which of the following is the best way to achieve this goal? (Select two).

Implementing DLP controls preventing sensitive data from leaving Company B's network

- A. Requiring data sensitivity labeling for all files shared with Company B
- **B. Reviewing the privacy policies currently adopted by Company B**
- C. Forcing a password reset requiring more stringent passwords for users on Company B's network
- **D. Documenting third-party connections used by Company B**
- E. Performing an architectural review of Company B's network

**Answer: B,D**

Explanation:

To determine how the acquisition of Company B will impact the attack surface, the following steps are crucial:

A: Documenting third-party connections used by Company B: Understanding all external connections is essential for assessing potential entry points for attackers and ensuring that these connections are secure.

E: Performing an architectural review of Company B's network: This review will identify vulnerabilities and assess the security posture of the acquired company's network, providing a comprehensive understanding of the new attack surface.

These actions will provide a clear picture of the security implications of the acquisition and help in developing a plan to mitigate any identified risks.

#### NEW QUESTION # 130

A company is rewriting a vulnerable application and adding the `mprotect()` system call in multiple parts of the application's code that was being leveraged by a recent exploitation tool.

Which of the following should be enabled to ensure the application can leverage the new system call against similar attacks in the future?

- A. HSM
- B. TPM
- **C. NX bit**
- D. Secure boot

**Answer: C**

Explanation:

The NX bit (No eXecute bit) is a security feature that marks certain areas of memory as non-executable. This prevents code from being run in those areas, which is a common technique used in modern operating systems to protect against buffer overflow and other exploits. When the application leverages the `mprotect()` system call, it can mark memory regions as non-executable, making it more difficult for attackers to execute injected malicious code. By enabling the NX bit, the system enforces that no code can be executed from areas that should only contain data, preventing certain types of exploits.

#### NEW QUESTION # 131

A security engineer wants to enhance the security posture of end-user systems in a Zero Trust environment. Given the following requirements:

- . Reduce the ability for potentially compromised endpoints to contact command-and-control infrastructure.
- . Track the requests that the malware makes to the IPs.
- . Avoid the download of additional payloads.

Which of the following should the engineer deploy to meet these requirements?

- A. HIDS
- B. Zone transfer protection

- C. Browser isolation
- **D. DNS sinkholing**

**Answer: D**

### NEW QUESTION # 132

A local government that is investigating a data exfiltration claim was asked to review the fingerprint of the malicious user's actions. An investigator took a forensic image of the VM and downloaded the image to a secured USB drive to share with the government. Which of the following should be taken into consideration during the process of releasing the drive to the government?

- A. Encryption in transit
- B. Order of volatility
- C. Key exchange
- **D. Chain of custody**
- E. Legal issues

**Answer: D**

Explanation:

Chain of custody ensures that evidence is protected, documented, and accounted for from the moment it is collected until it is presented in court or a legal proceeding. Properly maintaining chain of custody is critical to proving that the evidence has not been tampered with. Although encryption protects data during transit, and legal issues are important, without a documented chain of custody, the integrity of the evidence itself could be challenged and invalidated.

### NEW QUESTION # 133
