Data-Architect Test Dumps Pdf - Latest Braindumps Data-Architect Book

The desktop-based practice exam software is the first format that Data-Architect provides to its customers. It allows candidates to track their progress from start to finish and provides an easily accessible progress report. This Salesforce Data-Architect Practice Questions is customizable and mimics the real exam's format. It is user-friendly on Windows-based computers, and the product support staff is available to assist with any issues that may arise.

To prepare for the Salesforce Certified Data Architect exam, candidates should have a strong understanding of Salesforce data management concepts, as well as experience working with various Salesforce data tools and technologies. They should also be familiar with industry-standard data modeling and database design principles, and have a good understanding of data integration and security best practices. With the right preparation and a solid understanding of the exam content, candidates can successfully pass the Salesforce Certified Data Architect exam and take their career to the next level.

Salesforce Certified Data Architect Sample Questions (Q119-Q124):

NEW QUESTION # 119

Universal Containers (UC) has multi-level account hierarchies that represent departments within their major Accounts. Users are creating duplicate Contacts across multiple departments. UC wants to clean the data so as to have a single Contact across departments. What two solutions should UC implement to cleanse their data? Choose 2 answers

- A. Make use of a third-party tool to help merge duplicate Contacts across Accounts.
- B. Use Workflow rules to standardize Contact information to identify and prevent duplicates.
- C. Use Data.com to standardize Contact address information to help identify duplicates.
- D. Make use of the Merge Contacts feature of Salesforce to merge duplicates for an Account.

Answer: A,C

Explanation:

Making use of a third-party tool to help merge duplicate Contacts across Accounts and using Data.com to standardize Contact address information to help identify duplicates are two solutions that UC should implement to cleanse their data and have a single Contact across departments. A third-party tool, such as an app from the AppExchange, can provide advanced features and capabilities for finding and merging duplicate Contacts across different Accounts, based on various criteria and rules. Data.com can provide address verification and standardization services that can enhance the quality and consistency of Contact address information and make it easier to identify duplicates. The other options are not feasible or effective for cleansing the data, as they would either not work across different Accounts, not address the root cause of duplication, or not provide sufficient functionality for merging duplicates

NEW QUESTION # 120

Universal Container require all customers to provide either a phone number or an email address when registering for an account. What should the data architect use to ensure this requirement is met?

- A. Apex Class
- B. Process Builder
- C. validation Rule
- D. required Fields

Answer: C

Explanation:

Using a validation rule is the best way to ensure that all customers provide either a phone number or an email address when registering for an account, as it allows defining a formula that evaluates whether a record meets certain criteria. Using required fields may not work if both phone number and email address are required.

Using an Apex class or a Process Builder may be more complex or cumbersome than using a validation rule.

NEW QUESTION # 121

NTO would like to retrieve their SF orgs meta data programmatically for backup within a various external. Which API is the best fit for accomplishing this task?

- A. Metadata API
- B. Tooling API
- C. SOAP API
- D. Bulk API in serial mode

Answer: A

NEW QUESTION # 122

Universal Containers has implemented Salesforce for its operations. In order for customers to be created in their MDM solution, the customer record needs to have the following attributes:

1. First Name
2. Last Name
3. Email

Which option should the data architect recommend to mandate this when customers are created in Salesforce?

- A. Mark Fields for the attributes as required under Setup.
- B. Build validation in Integration with MDM to check required attributes.
- C. Configure Page Layout marking attributes as required fields.
- D. Create validation rules to check if the required attributes are entered.

Answer: D

Explanation:

Creating validation rules to check if the required attributes are entered is the best option to mandate this when customers are created in Salesforce. Validation rules allow you to specify criteria that must be met before a record can be saved. You can use validation rules to ensure that customers have a first name, last name, and email when they are created in Salesforce. This way, you can prevent incomplete or invalid data from being sent to your MDM solution.

NEW QUESTION # 123

Universal Containers (UC) wants to store product data in Salesforce, but the standard Product object does not support the more complex hierarchical structure which is currently being used in the product master system.

How can UC modify the standard Product object model to support a hierarchical data structure in order to synchronize product data from the source system to Salesforce?

- A. Create a custom master-detail field on the standard Product to reference the child record in the hierarchy.
- B. Create a custom lookup field on the standard Product to reference the child record in the hierarchy.
- C. Create an Apex trigger to synchronize the Product Family standard picklist field on the Product object.
- **D. Create a custom lookup field on the standard Product to reference the parent record in the hierarchy.**

Answer: D

Explanation:

Creating a custom lookup field on the standard Product to reference the parent record in the hierarchy is the correct way to modify the standard Product object model to support a hierarchical data structure. This allows UC to create a self-relationship on the Product object and define parent-child relationships among products.
