## Snowflake SnowPro Core Certification Exam Sample Questions (Q936-Q941):

### NEW QUESTION # 936

What does Snowflake attempt to do if any of the compute resources for a virtual warehouse fail to provision during start-up?

- A. Repair the failed resources.
- B. Queue the failed resources
- C. Restart failed resources.
- D. Provision the failed resources

**Answer: C**

Explanation:

If any compute resources for a virtual warehouse fail to provision during startup, Snowflake will attempt to restart those failed resources. The system is designed to automatically handle transient issues that might occur during the provisioning of compute resources. By restarting the failed resources, Snowflake aims to ensure that the virtual warehouse has the necessary compute capacity to handle the user's workloads without manual intervention. ### NEW QUESTION # 937

What Snowflake recommendation is designed to ensure that staged data is only loaded once'?

- A. Identifying and removing duplicates after each data load
- B. Removing data files after loading
- C. Loading only the most recently-staged data files
- D. Partitioning staged data files

**Answer: B**

Explanation:

Snowflake recommends removing data files from the staging area after they have been loaded into the target table. This practice ensures that the data is only loaded once and prevents accidental reloading of the same data. By removing the files, you eliminate the risk of duplicate data loads.

Stage the Data: Upload the data files to a Snowflake stage (internal or external).

Load the Data: Use the COPY INTO command to load the data from the stage into the Snowflake table.

Remove the Data Files: After successfully loading the data, remove the data files from the stage using the REMOVE command.

### NEW QUESTION # 938

Snowflake Documentation on Resource Monitors: Managing Resource Monitors QUESTION NO:600 What is a feature of column-level security in Snowflake?

- A. External tokenization
- B. Role access policies
- C. Network policies
- D. Internal tokenization

**Answer: B**

Explanation:

Column-level security in Snowflake is implemented through Role Access Policies. These policies allow administrators to control access to specific columns of a table or view based on the role of the user accessing the data. By applying a role access policy to a column, administrators can ensure that sensitive information remains secure, and only users with the appropriate roles can view or query the data in that column. This feature enhances the security model by providing fine-grained access control at the column level. References:

### NEW QUESTION # 939

What is the default character set used when loading CSV files into Snowflake?

- A. UTF-16
- B. ANSI\_X3.A
- C. UTF-8
- D. ISO 8859-1

**Answer: C**

### NEW QUESTION # 940

Which activities are managed by Snowflake's Cloud Services layer? (Select TWO).

- A. Access delegation
- B. Data pruning
- C. Query parsing and optimization
- D. Authorisation
- E. Data compression

**Answer: C,D**

Explanation:

Snowflake's Cloud Services layer is responsible for managing various aspects of the platform that are not directly related to computing or storage. Specifically, it handles authorisation, ensuring that users have appropriate access rights to perform actions or access data. Additionally, it takes care of query parsing and optimization, interpreting SQL queries and optimizing their execution plans for better performance. This layer abstracts much of the platform's complexity, allowing users to focus on their data and queries without managing the underlying infrastructure.
