If you have any doubt about this, we will provide you professional personnel to remotely guide the installation and use.

Linux Foundation Certified GitOps Associate Sample Questions (Q60-Q65):

NEW QUESTION # 60

Which of these Git commands will enact a rollback of the configuration to a previous commit?

- A. git branch
- B. git commit
- C. git revert
- D. git push

Answer: C

Explanation:

In GitOps, rollback is performed by reverting the system's Desired State stored in Git. This is done with the `git revert` command, which creates a new commit that undoes the changes introduced by a previous commit.

"Because Git provides an immutable history of changes, rollbacks are straightforward. Reverting to a previous configuration is accomplished by reverting the commit in Git, which then allows the reconciler to apply the earlier desired state." Thus, the correct answer is B: git revert.

NEW QUESTION # 61

What is an example of how GitOps helps DevSecOps?

- A. You must sign into your GitHub account before running `kubectl` commands.

- B. The entire version history of Desired State changes is available for auditing.
- C. Store all access tokens in Git.
- D. Unit testing during CD limits the bugs introduced into deployed code.

Answer: B

Explanation:

GitOps enhances DevSecOps by ensuring security-related configurations and changes are stored in version control, where a complete audit history is available. This provides traceability, accountability, and compliance enforcement.

"With GitOps, the entire version history of desired state changes is stored immutably in Git. This audit trail supports security and compliance goals in DevSecOps practices." Thus, the correct answer is B.

NEW QUESTION # 62

Which of the following is an example of an external reconciler?

- A. KubeFlow
- B. Flux
- C. Kustomize
- D. Helm

Answer: B

Explanation:

An external reconciler ensures that the actual system matches the desired state declared in Git. External reconcilers run outside the core cluster orchestration process. Flux is a widely used GitOps external reconciler that continuously syncs cluster state with the repository.

"Flux is an example of a GitOps reconciler that continuously monitors Git repositories and applies changes to the cluster. As an external reconciler, it handles synchronization and reconciliation loops outside the direct application code." Thus, A: Flux is correct.

NEW QUESTION # 63

In a GitOps-managed workflow, what is the correct way to initiate rollback?

- A. Revert to an older version and force push to the main branch.
- B. Overwrite your existing version with the code from your last working version.
- C. Use Helm to rollback to a previous release version.
- D. Create a new version based on a former version so you always "roll forward".

Answer: D

Explanation:

In GitOps, rollback is handled via version control. However, the practice is not to overwrite history but to roll forward by creating a new version that reverts to the configuration of a previous known-good commit. This maintains immutability and a complete audit trail.

"With GitOps, changes are versioned immutably. Rollbacks are performed by rolling forward to a commit that represents a previous known-good configuration, ensuring history is preserved." Thus, the correct GitOps approach is B.

NEW QUESTION # 64

You are deploying a new version of your application using the Blue-Green deployment pattern. What is a characteristic of the Blue-Green deployment pattern?

- A. The old version of the application is deployed first, followed by the new version.
- B. Both the new and old versions of the application are deployed simultaneously.
- C. The Blue-Green deployment pattern only deploys single versions of the application.
- D. The new version of the application is deployed first, followed by the old version.

Answer: B

Explanation:

In a Blue-Green deployment, two environments (Blue and Green) exist at the same time. The current version runs in one environment (Blue), and the new version is deployed to the other environment (Green). Traffic is switched to Green once the new version is validated.

"Blue-Green deployments maintain two production environments. The new version is deployed alongside the old version, and once validated, traffic is switched from Blue to Green." Thus, the correct answer is C.
