

CheckPoint 156-315.81 Real Torrent & 156-315.81 Real Testing Environment

P.S. Free & New 156-315.81 dumps are available on Google Drive shared by Itcertking: <https://drive.google.com/open?id=1aGHsISRCGgIMjYzmo3N-e-uYkdDzhoHS>

Our 156-315.81 exam dumps strive for providing you a comfortable study platform and continuously explore more functions to meet every customer's requirements. We may foresee the prosperous talent market with more and more workers attempting to reach a high level through the CheckPoint certification. To deliver on the commitments of our 156-315.81 Test Prep that we have made for the majority of candidates, we prioritize the research and development of our 156-315.81 test braindumps, establishing action plans with clear goals of helping them get the CheckPoint certification. You can totally rely on our products for your future learning path.

The CheckPoint 156-315.81 Exam covers a broad range of topics, including advanced firewall configuration, VPNs, network security, intrusion prevention systems, and endpoint security management. Candidates are required to have a deep understanding of Check Point Security systems and be able to apply their knowledge to real-world scenarios.

156-315.81 Real Testing Environment, Test 156-315.81 Score Report

The page of our 156-315.81 simulating materials provides demo which are sample questions. The purpose of providing demo is to let customers understand our part of the topic and what is the form of our 156-315.81 study materials when it is opened? In our minds, these two things are that customers who care about the 156-315.81 Exam may be concerned about most. We will give you our software which is a clickable website that you can visit the product page.

What is the cost of the CheckPoint 156-315.81 Exam

The price of the CheckPoint 156-315.81 Exam is USD 250.

CheckPoint Check Point Certified Security Expert R81 Sample Questions

(Q200-Q205):

NEW QUESTION # 200

To fully enable Dynamic Dispatcher with Firewall Priority Queues on a Security Gateway, run the following command in Expert mode then reboot:

- A. fw ctl multik set mode 1
- B. fw ctl Dynamic_Priority_Queue on
- C. fw ctl multik set mode 9
- D. fw ctl Dynamic_Priority_Queue enable

Answer: C

Explanation:

Explanation

Dynamic Dispatcher is a feature that optimizes the performance of Security Gateways with multiple CPU cores by dynamically allocating traffic to different cores based on their load and priority. Firewall Priority Queues is a feature that prioritizes traffic based on its type and importance by assigning it to different queues with different weights and limits. To fully enable Dynamic Dispatcher with Firewall Priority Queues on a Security Gateway, you need to run the following command in Expert mode then reboot:

This command sets the multi-core mode to 9, which means that Dynamic Dispatcher is enabled with Firewall Priority Queues. The other commands are not valid or do not enable both features. References: R81 Performance Tuning Administration Guide

NEW QUESTION # 201

With MTA (Mail Transfer Agent) enabled the gateways manages SMTP traffic and holds external email with potentially malicious attachments. What is required in order to enable MTA (Mail Transfer Agent) functionality in the Security Gateway?

- A. Threat Prevention Software Blade Package
- B. Threat Cloud Intelligence
- C. Endpoint Total Protection
- D. Traffic on port 25

Answer: A

Explanation:

To enable MTA (Mail Transfer Agent) functionality in the Security Gateway, the Threat Prevention Software Blade Package is required. The Threat Prevention Software Blade Package includes the Anti-Virus, Anti-Bot, and Threat Emulation blades, which can scan and hold external email with potentially malicious attachments. The MTA functionality allows the Security Gateway to act as an SMTP relay between the mail server and the Internet, and apply Threat Prevention policies to the email traffic. The other options are either not related or not sufficient to enable MTA functionality. R

NEW QUESTION # 202

What has to be taken into consideration when configuring Management HA?

- A. If you wanted to use Full Connectivity Upgrade, you must change the Implied Rules to allow FW1_cp redundant to pass before the Firewall Control Connections.
- B. SmartConsole must be closed prior to synchronized changes in the objects database
- C. For Management Server synchronization, only External Virtual Switches are supported. So, if you wanted to employ Virtual Routers instead, you have to reconsider your design.
- D. The Database revisions will not be synchronized between the management servers

Answer: D

Explanation:

When configuring Management HA, you have to take into consideration that the Database revisions will not be synchronized between the management servers. Database revisions are snapshots of the database that are created manually or automatically when installing a policy or saving changes. They are stored locally on each management server and are not replicated by Management HA. The other options are either not true or not relevant to Management HA. Reference: Check Point R81 Installation and Upgrade

NEW QUESTION # 203

Which command can you use to verify the number of active concurrent connections?

- A. fw conn all
- B. show connections
- C. show all connections
- D. fw ctl pstat

Answer: D

NEW QUESTION # 204

Fill in the blank: A _____ VPN deployment is used to provide remote users with secure access to internal corporate resources by authenticating the user through an internet browser.

- A. Client-based remote access
- B. Clientless direct access
- C. Direct access
- D. Clientless remote access

Answer: D

Explanation:

A clientless remote access VPN deployment is used to provide remote users with secure access to internal corporate resources by authenticating the user through an internet browser. A clientless remote access VPN does not require any software installation or configuration on the user's device. Instead, it uses a web-based portal that acts as a proxy between the user and the corporate resources. The user can access web applications and services through the portal using a standard web browser that supports SSL/TLS encryption. The portal can also provide single sign-on (SSO) capabilities for SAML-enabled applications. A clientless remote access VPN is suitable for scenarios where users need to access mainly web-based resources from unmanaged devices or devices that cannot run VPN clients.

The other options are incorrect because:

A client-based remote access VPN deployment is used to provide remote users with secure access to internal corporate resources by installing a VPN client software on the user's device. A client-based remote access VPN requires software installation and configuration on the user's device. It uses IPsec or SSL/TLS protocols to create a secure tunnel between the user's device and the VPN gateway. The user can access any type of resource through the tunnel using any application that supports TCP/IP protocols. A client-based remote access VPN is suitable for scenarios where users need to access various types of resources from managed devices or devices that can run VPN clients.

A clientless direct access deployment is not a valid term for a VPN deployment. Direct access is a feature of Windows Server that allows remote users to securely access internal corporate resources without using a VPN connection. Direct access uses IPv6 transition technologies and IPsec protocols to create a secure connection between the user's device and the direct access server. The user can access any type of resource through the connection using any application that supports TCP/IP protocols. Direct access requires software installation and configuration on both the user's device and the direct access server.

A direct access deployment is not a term for a VPN deployment, but a feature of Windows Server that allows remote users to securely access internal corporate resources without using a VPN connection. Direct access uses IPv6 transition technologies and IPsec protocols to create a secure connection between the user's device and the direct access server. The user can access any type of resource through the connection using any application that supports TCP/IP protocols. Direct access requires software installation and configuration on both the user's device and the direct access server.
