Clearer CAS-004 Explanation & Pdf CAS-004 Free

Generally speaking, a satisfactory practice material should include the following traits. High quality and accuracy rate with reliable services from beginning to end. As the most professional group to compile the content according to the newest information, our CAS-004 practice materials contain them all, and in order to generate a concrete transaction between us we take pleasure in making you a detailed introduction of our CAS-004 practice materials. We would like to take this opportunity and offer you a best CAS-004 practice material as our strongest items as follows. Here are detailed specifications of our product.

The CompTIA CAS-004 exam is designed to test the candidate's ability to conceptualize, design, and implement secure solutions across a variety of environments. It is an advanced-level certification that requires a thorough understanding of cybersecurity concepts, technologies, and practices. CAS-004 exam is also designed to test the candidate's ability to analyze and respond to security incidents and vulnerabilities.

Following is the info about the Passing Score, Duration & Questions for the CompTIA CAS-004 Exam

- Time Duration: 165 minutes

- Languages: English, Japanese

- The passing score: it's pass/fail only.

>> Clearer CAS-004 Explanation <<

Pdf CAS-004 Free - Online CAS-004 Test

If you want to find a good job，you must own good competences and skillful major knowledge. So owning the CAS-004 certification is necessary for you because we will provide the best CAS-004 study materials to you. Our CAS-004 exam torrent is of high quality and efficient, and it can help you pass the test successfully. For the CAS-004 training guide we provide with you is compiled by professionals elaborately and boosts varied versions which aimed to help you learn the CAS-004 study materials by the method which is convenient for you. And you can pass the exam with success guaranteed.

CompTIA Advanced Security Practitioner (CASP+) Exam Sample Questions (Q530-Q535):

NEW QUESTION # 530
A company recently deployed new servers to create an additional cluster to support a new application. The corporate security policy states that all new servers must be resilient. The new cluster has a high-availability configuration for a smooth failover. The failover was successful following a recent power outage, but both clusters lost critical data, which impacted recovery time.
Which of the following needs to be configured to help ensure minimal delays when power outages occur in the future?

- A. Caching
- B. Replication
- C. Containerization
- D. Redundancy
- E. High availability

Answer: B

NEW QUESTION # 531
A technology company developed an in-house chat application that is used only by developers. An open- source library within the application has been deprecated. The facts below are provided:
*The cost of replacing this system is nominal.
*The system provides no revenue to the business.
*The system is not a critical part of the business.
Which of the following is the best risk mitigation strategy?

- A. Avoid the risk by shutting down this application and migrating to another chat platform.
- B. Mitigate the risk by purchasing an EDR and configuring network ACLs.
- C. Accept the risk, since any system disruption will only impact developers.
- D. Transfer the risk, since developers prefer using this chat application over alternatives.

Answer: A

Explanation:
Avoiding the risk by shutting down the application and migrating to a supported, alternative platform is the most effective option based on the provided scenario. The application is non-critical, provides no revenue, and replacing it has a nominal cost, making risk avoidance the ideal choice. This aligns with the CASP+ objective of implementing risk strategies (1.3) and emphasizes prioritizing cost-effective and practical solutions over maintaining deprecated or vulnerable systems.

_____

NEW QUESTION # 532
A recent data breach revealed that a company has a number of files containing customer data across its storage environment. These files are individualized for each employee and are used in tracking various customer orders, inquiries, and issues. The files are not encrypted and can be accessed by anyone. The senior management team would like to address these issues without interrupting existing processes.
Which of the following should a security architect recommend?

- A. An ERP program to identify which processes need to be tracked
- B. A CMDB to report on systems that are not configured to security baselines
- C. A DLP program to identify which files have customer data and delete them
- D. A CRM application to consolidate the data and provision access based on the process and need

Answer: D

NEW QUESTION # 533

In preparation for the holiday season, a company redesigned the system that manages retail sales and moved it to a cloud service provider. The new infrastructure did not meet the company's availability requirements.
During a postmortem analysis, the following issues were highlighted:
1. International users reported latency when images on the web page were initially loading.
2. During times of report processing, users reported issues with inventory when attempting to place orders.
3. Despite the fact that ten new API servers were added, the load across servers was heavy at peak times.
Which of the following infrastructure design changes would be BEST for the organization to implement to avoid these issues in the future?

- A. Serve static-content object storage across different regions, increase the instance size on the managed relational database, and distribute the ten API servers across multiple regions.
- B. Serve static content via distributed CDNs, create a read replica of the central database and pull reports from there, and auto-scale API servers based on performance.
- C. Increase the bandwidth for the server that delivers images, use a CDN, change the database to a non-relational database, and split the ten API servers across two load balancers.
- D. Serve images from an object storage bucket with infrequent read times, replicate the database across different regions, and dynamically create API servers based on load.

Answer: B

Explanation:
This solution would address the three issues as follows:
* Serving static content via distributed CDNs would reduce the latency for international users by delivering images from the nearest edge location to the user's request.
* Creating a read replica of the central database and pulling reports from there would offload the read-intensive workload from the primary database and avoid affecting the inventory data for order placement.
* Auto-scaling API servers based on performance would dynamically adjust the number of servers to match the demand and balance the load across them at peak times.

NEW QUESTION # 534

A software developer needs to add an authentication method to a web application. The following requirements must be met:
* The web application needs to use well-supported standards.
* The initial login to the web application should rely on an outside, trusted third party.
* The login needs to be maintained for up to six months.
Which of the following would best support these requirements? (Select two).

- A. JWT
- B. Remote attestation
- C. Kerberos
- D. EAP
- E. RADIUS
- F. SAML

Answer: A,F

Explanation:
To meet the requirements for authentication using trusted third parties and session maintenance, SAML (Security Assertion Markup Language) and JWT (JSON Web Token) are the best options. SAML is widely used for single sign-on (SSO) and federated authentication, allowing users to authenticate with an external identity provider (trusted third party). JWT is commonly used for maintaining authenticated sessions across web applications and is well-suited for long-term session management, like the six-month duration mentioned. Together, these solutions meet the requirements for standards-based authentication and long-lasting sessions.

CASP+ discusses the role of SAML in federated identity management and JWT in token-based authentication.
