## Amazon AWS Certified Cloud Practitioner Sample Questions (Q37-Q42):

### NEW QUESTION # 37

Which AWS service provides the ability to manage infrastructure as code?

- A. AWS CloudFormation
- B. AWS CodeDeploy
- C. AWS Direct Connect
- D. AWS CodePipeline

### Answer: A

Explanation:

Explanation

The AWS service that provides the ability to manage infrastructure as code is AWS CloudFormation.

Infrastructure as code is a process of defining and provisioning AWS resources using code or templates, rather than manual actions or scripts. AWS CloudFormation allows you to create and update stacks of AWS resources based on predefined templates that describe the desired state and configuration of the resources.

AWS CloudFormation automates and simplifies the deployment and management of AWS resources, and ensures consistency and repeatability across different environments and regions. AWS CloudFormation also supports rollback, change sets, drift detection, and nested stacks features that help you to monitor and control the changes to your infrastructure1.

### NEW QUESTION # 38

Which of the following is an advantage that users experience when they move on-premises workloads to the AWS Cloud?

- A. Distribution of all operational controls to AWS
- B. Price discounts that are identical to discounts from hardware providers
- C. Elimination of operational expenses
- D. **Elimination of expenses for running and maintaining data centers**

### Answer: D

Explanation:

The advantage that users experience when they move on-premises workloads to the AWS Cloud is:

elimination of expenses for running and maintaining data centers. By moving on-premises workloads to the AWS Cloud, users can reduce or eliminate the costs associated with owning and operating physical servers, storage, network equipment, and facilities.

These costs include hardware purchase, maintenance, repair, power, cooling, security, and staff. Users can also benefit from the pay-as-you-go pricing model of AWS, which allows them to pay only for the resources they use, and scale up or down as needed.

### NEW QUESTION # 39

A company wants to migrate its on-premises infrastructure to the AWS Cloud. Which advantage of cloud computing will help the company reduce upfront costs?

- A. Benefit from massive economies of scale
- B. Increase speed and agility
- **C. Trade fixed expense for variable expense**
- D. Go global in minutes

#### Answer: C

Explanation:

One of the key advantages of cloud computing is the ability to trade fixed expenses (like data centers and physical servers) for variable expenses. With AWS, companies pay only for the compute power, storage, and other resources they use, rather than investing heavily in on-premises infrastructure upfront. This reduces capital expenditure and helps lower overall costs.

Why other options are not suitable:

- \* A. Go global in minutes: Refers to the ability to quickly deploy applications around the world, but does not directly reduce upfront costs.
- \* B. Increase speed and agility: Refers to the ability to quickly scale and deploy resources, but is not directly related to cost reduction.
- \* C. Benefit from massive economies of scale: Refers to AWS's ability to lower costs by leveraging its scale, but the primary advantage for reducing upfront costs is moving from fixed to variable expenses.

### NEW QUESTION # 40

A company has set up a VPC on AWS. The company needs a dedicated connection between the VPC and the company's on-premises network.

Which action should the company take to meet this requirement?

- A. Attach an internet gateway to the VPC. Use the AWS public endpoints for connectivity.
- B. Establish a VPN connection between the VPC and the company's on-premises network.
- **C. Establish an AWS Direct Connect connection between the VPC and the company's on-premises network.**
- D. Configure Amazon Connect to provide connectivity between the VPC and the company's on-premises network.

#### Answer: C

Explanation:

Establishing an AWS Direct Connect connection between the VPC and the company's on-premises network is the action that the company should take to meet the requirement of having a dedicated connection between the VPC and the company's on-premises network. AWS Direct Connect is a service that lets you establish a dedicated network connection between your network and one of the AWS Direct Connect locations. Using AWS Direct Connect, you can create a private connection between AWS and your datacenter, office, or colocation environment, which can reduce your network costs, increase bandwidth throughput, and provide a more consistent network experience than internet-based connections. Establishing a VPN connection between the VPC and the company's on-premises network is an action that the company can take to create a secure and encrypted connection between the VPC and the company's on-premises network, but it is not a dedicated connection, as it uses the public internet as the transport mechanism. Attaching an internet gateway to the VPC and using the AWS public endpoints for connectivity is an action that the company can take to enable communication between the VPC and the internet, but it is not a dedicated connection, as it also uses the public internet as the transport mechanism. Configuring Amazon Connect to provide connectivity between the VPC and the company's on-premises network is not an action that the company can take, because Amazon Connect is a service that lets you set up and manage a contact center in the cloud, but it does not provide network connectivity between the VPC and the company's on-premises network.

### NEW QUESTION # 41

Which VPC component provides a layer of security at the subnet level?

- A. Route tables

- B. Network ACLs
- C. NAT gateways
- D. Security groups

**Answer: B**

Explanation:

Explanation

Network ACLs are a feature that provide a layer of security at the subnet level by acting as a firewall to control traffic in and out of one or more subnets. Network ACLs can be configured with rules that allow or deny traffic based on the source and destination IP addresses, ports, and protocols<sup>5</sup>. Security groups are a feature that provide a layer of security at the instance level by acting as a firewall to control traffic to and from one or more instances. Security groups can be configured with rules that allow or deny traffic based on the source and destination IP addresses, ports, protocols, and security groups. NAT gateways are a feature that enable instances in a private subnet to connect to the internet or other AWS services, but prevent the internet from initiating a connection with those instances. Route tables are a feature that determine where network traffic from a subnet or gateway is directed.
