If you are not aware of your problem, please take a good look at the friends around you! Now getting an international Cloud-Deployment-and-Operations certificate has become a trend. If you do not hurry to seize the opportunity, you will be far behind others! Now the time cost is so high, choosing Cloud-Deployment-and-Operations Exam Prep will be your most efficient choice. You can pass the Cloud-Deployment-and-Operations exam in the shortest possible time to improve your strength.

WGU Cloud Deployment and Operations Sample Questions (Q53-Q58):

NEW QUESTION # 53

(Media files are stored in an S3 bucket in region A. Demand for the files from region B has increased. Region B is suffering from some latency issues due to geographical location. Which type of replication will reduce the latency in region B?)

- A. Same-Region
- B. S3 Versioning
- **C. Cross-Region**
- D. S3 Batch

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To reduce latency in region B due to increased demand for media files stored in region A, cross-region replication (CRR) should be used. CRR replicates objects to an S3 bucket in another region (e.g., region B), allowing users to access files from a closer location, thus minimizing latency. The WGU Cloud Deployment and Operations Study Guide (Section 2.2, S3 Replication) states, "Cross-Region Replication in S3 copies objects to a destination bucket in a different region, reducing latency by enabling access to data from the nearest region, such as region B in this case." S3 Batch, S3 Versioning, and Same-Region replication do not address cross-region latency.

NEW QUESTION # 54

(An administrator needs to set up self-managed permissions for AWS CloudFormation StackSet operations. Which two roles should be created in the administrator account and in the target accounts? Choose 2 answers.)

- A. In the administrator account, create an IAM role named `AWSCloudFormationStackSetExecutionRole`.
- B. In each target account, create a service role named `AWSCloudFormationStackSetAdministrationRole` that trusts the administrator account.
- **C. In the administrator account, create an IAM role named `AWSCloudFormationStackSetAdministrationRole`.**
- **D. In each target account, create a service role named `AWSCloudFormationStackSetExecutionRole` that trusts the administrator account.**

Answer: C,D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To set up self-managed permissions for CloudFormation StackSet operations, two roles are required: in the administrator account, create an IAM role named `AWSCloudFormationStackSetAdministrationRole` to manage StackSet operations, and in each target account, create a service role named `AWSCloudFormationStackSetExecutionRole` that trusts the administrator account to execute the stacks. The WGU Cloud Deployment and Operations Study Guide (Section 5.4, StackSets) states, "For self-managed permissions, the administrator account requires the `AWSCloudFormationStackSetAdministrationRole`, while each target account needs the `AWSCloudFormationStackSetExecutionRole` with a trust relationship to the administrator account for stack deployment." Roles B and D are incorrectly named or misplaced.

NEW QUESTION # 55

(Which Performance Insights view provides information on the hardware resource that may be causing a bottleneck?)

- A. Users

- B. Hosts
- C. Statement
- **D. Wait event**

Answer: D

Explanation:

The Wait event view in Amazon RDS Performance Insights provides information on hardware resources (e.g., CPU, I/O, memory) that may be causing bottlenecks by showing wait times for database operations. The WGU Cloud Deployment and Operations Study Guide (Section 7.2, Performance Insights) states, "The Wait event view in Performance Insights identifies resource bottlenecks (e.g., I/O wait times) by analyzing wait states, helping optimize database performance on hardware resources." Users, Hosts, and Statement views focus on different aspects and do not directly address hardware bottlenecks.

NEW QUESTION # 56

(What should be used to monitor estimated AWS charges?)

- **A. Billing alarm**
- B. Pricing Calculator
- C. Forecast
- D. Cognito

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

A Billing alarm in Amazon CloudWatch should be used to monitor estimated AWS charges by setting thresholds on cost metrics and triggering notifications when exceeded. This helps manage budgets effectively.

The WGU Cloud Deployment and Operations Study Guide (Section 7.4, Cost Monitoring) states, "Billing alarms in CloudWatch monitor estimated charges against a defined threshold, sending alerts via SNS to prevent cost overruns." Cognito handles user authentication, Pricing Calculator estimates costs pre- deployment, and Forecast predicts usage, none of which monitor real-time charges.

NEW QUESTION # 57

(What is the role of a patch baseline in Patch Manager?)

- A. Assigns an IAM role for services that can auto-approve patches upon release
- B. Installs all patch updates as they become available by default
- **C. Defines patches that should and should not be installed on EC2 instances**
- D. Notifies Config of any patch updates that need to be performed

Answer: C

Explanation:

A patch baseline in Patch Manager defines the patches that should and should not be installed on EC2 instances, specifying approval rules for security updates, other updates, and exclusions. This ensures controlled and compliant patching. The WGU Cloud Deployment and Operations Study Guide (Section 5.2, Patch Manager) states, "A patch baseline specifies which patches are approved for installation and which are excluded, allowing customization of patch deployment (e.g., approving only critical security updates)." Options A, B, and D misrepresent the baseline's role, as it does not auto-install, assign IAM roles, or notify Config directly.
