## **Snowflake SnowPro Core Certification Exam Sample Questions (Q68-Q73):**

### **NEW QUESTION # 68**

A user has an application that writes a new Tile to a cloud storage location every 5 minutes.

What would be the MOST efficient way to get the files into Snowflake?

- A. Create a task that puts the files in an internal stage and automate the data loading wizard
- **B. Set up cloud provider notifications on the Tile location and use Snowpipe with auto-ingest**
- C. Create a task that runs a copy into operation from an external stage every 5 minutes
- D. Create a task that runs a GET operation to intermittently check for new files

### **Answer: B**

Explanation:

The most efficient way to get files into Snowflake, especially when new files are being written to a cloud storage location at frequent intervals, is to use Snowpipe with auto-ingest. Snowpipe is Snowflake's continuous data ingestion service that loads data as soon as it becomes available in a cloud storage location.

By setting up cloud provider notifications, Snowpipe can be triggered automatically whenever new files are written to the storage location, ensuring that the data is loaded into Snowflake with minimal latency and without the need for manual intervention or scheduling frequent tasks.

### **NEW QUESTION # 69**

How does Snowflake handle the data retention period for a table if a stream has not been consumed?

- A. The data retention period is permanently extended for the table.
- B. The data retention period is not affected by the stream consumption.
- C. The data retention period is reduced to a minimum of 14 days.
- **D. The data retention period is temporarily extended to the stream's offset.**

### **Answer: D**

Explanation:

In Snowflake, the use of streams impacts how the data retention period for a table is handled, particularly in scenarios where the stream has not been consumed. The key point to understand is that Snowflake's streams are designed to capture data manipulation language (DML) changes such as INSERTS, UPDATES, and DELETES that occur on a source table. Streams maintain a record of these changes until they are consumed by a DML operation or a COPY command that references the stream.

When a stream is created on a table and remains unconsumed, Snowflake extends the data retention period of the table to ensure that the changes captured by the stream are preserved. This extension is specifically up to the point in time represented by the stream's offset, which effectively ensures that the data necessary for consuming the stream's contents is retained. This mechanism is in place to prevent data loss and ensure the integrity of the stream's data, facilitating accurate and reliable data processing and analysis based on the captured DML changes.

This behavior emphasizes the importance of managing streams and their consumption appropriately to balance between data retention needs and storage costs. It's also crucial to understand how this temporary extension of the data retention period impacts the overall management of data within Snowflake, including aspects related to data lifecycle, storage cost implications, and the planning of data consumption strategies.

### **NEW QUESTION # 70**

Which metadata table will store the storage utilization information even for dropped tables?

- **A. STAGE STORAGE USAGE HISTORY**

- B. TABLE\_STORAGE\_METRICS
- C. DATABASE\_STORAGE\_USAGE\_HISTORY
- D. STORAGE\_DAILY\_HISTORY

**Answer: B**

Explanation:

The TABLE\_STORAGE\_METRICS metadata table stores the storage utilization information, including for tables that have been dropped but are still incurring storage costs.

#### **NEW QUESTION # 71**

Which Snowflake feature allows a user to substitute a randomly generated identifier for sensitive data, in order to prevent unauthorized users access to the data, before loading it into Snowflake?

- A. External Tables
- B. User-Defined Table Functions (UDTF)
- C. External Tokenization
- D. Materialized Views

**Answer: C**

#### **NEW QUESTION # 72**
