If you're looking to establish a career in IT or want to gain a deeper understanding of Linux, passing the Lpi 010-160 Exam is an excellent place to start.

Lpi Linux Essentials Certificate Exam - version 1.6 Sample Questions (Q14-Q19):

NEW QUESTION # 14

The file script.sh in the current directory contains the following content:

```
#!/bin/bash echo $MYVAR
```

The following commands are used to execute this script:

MYVAR=value

./script.sh

The result is an empty line instead of the content of the variable MYVAR. How should MYVAR be set in order to make script.sh display the content of MYVAR?

- A. \$MYVAR=value
- B. export MYVAR=value
- C. env MYVAR=value
- D. !MYVAR=value
- E. MYVAR=value

Answer: B

Explanation:

Explanation

The reason why the script.sh does not display the content of the variable MYVAR is that the variable is not exported to the environment of the script. When a script is executed, it runs in a separate process that inherits the environment variables from the parent process, but not the shell variables. A shell variable is a variable that is defined and visible only in the current shell session, while an environment variable is a variable that is exported to the environment and visible to all processes that run in that environment¹.

To make a shell variable an environment variable, we need to use the export command. The export command takes a shell variable name and adds it to the environment of the current shell and any subshells or processes that are created from it². For example, to export the variable MYVAR with the value value, we can use:

export MYVAR=value

This will make the variable MYVAR available to the script.sh when it is executed, and the script will print the value of MYVAR as expected. Alternatively, we can also use the export command with the -n option to remove a variable from the environment, or with the -p option to list all the environment variables².

The other options are not valid ways to set MYVAR as an environment variable. The !MYVAR=value option is not a valid syntax for setting a variable in bash. The env MYVAR=value option will run the env command with the MYVAR=value argument, which will print the environment variables with the addition of MYVAR=value, but it will not affect the current shell or the script.sh³. The MYVAR=value option will set MYVAR as a shell variable, but not as an environment variable, so it will not be visible to the script.sh¹. The

\$MYVAR=value option will try to set the variable whose name is the value of MYVAR to the value value, which is not what we want⁴. References:

NEW QUESTION # 15

Which of the following commands are used to get information on the proper use of ls? (Choose two.)

- A. info ls
- B. manual ls
- C. man ls
- D. option ls
- E. usage ls

Answer: A,C

NEW QUESTION # 16

Which of the following statements is true about Free Software?

- A. It only runs on Linux.
- B. It is only distributed as a compiled binary.
- C. It must always be available free of charge.
- D. It may be modified by anyone using it.
- E. It is developed by volunteers only.

Answer: D

NEW QUESTION # 17

Which of the following statements regarding Linux hardware drivers is correct?

- A. Drivers are regular Linux programs which have to be run by the user who wants to use a device.
- B. Drivers are downloaded from the vendor's driver repository when a new device is attached.
- **C. Drivers are either compiled into the Linux kernel or are loaded as kernel modules.**
- D. Drivers are stored on their devices and are copied by the Linux kernel when a new device is attached
- E. Drivers are not used by Linux because the BIOS handles all access to hardware on behalf of Linux.

Answer: C

NEW QUESTION # 18

Which of the following outputs could stem from the command last?

- A. EXT4-fs (dm-7): mounted filesystem with ordered data mode. Opts: (null)
- **B. root tty2 Wed May 17 21:11 - 21:11 (00:00)**
- C. Password for user last changed at Sat Mar 31 16:38:57 EST 2018
- D. Last login: Fri Mar 23 10:56:39 2018 from server.example.com
- E. 1 ls
2 cat text.txt
3 logout

Answer: B

Explanation:

The last command in Linux is used to display the list of all the users logged in and out since the file `/var/log/wtmp` was created¹. The output of the last command shows the username, the terminal, the IP address, the login time and date, and the duration of the session for each record². The option E is the only one that matches this format. The other options are not related to the last command. Option A shows a list of commands executed by a user. Option B shows the password change information for a user. Option C shows the last login information for a user. Option D shows the mount information for a filesystem.
