Preparation for the professional CompTIA Advanced Security Practitioner (CASP+) Exam (CAS-004) exam is no more difficult because experts have introduced the preparatory products. With Actual4Exams products, you can pass the CompTIA CAS-004 Exam on the first attempt. If you want a promotion or leave your current job, you should consider achieving a professional certification like CompTIA Advanced Security Practitioner (CASP+) Exam (CAS-004) exam.

We own three versions of the CAS-004 exam torrent for you to choose. They conclude PDF version, PC version and APP online version. You can choose the most convenient version of the CAS-004 quiz torrent. The three versions of the CAS-004 test prep boost different strengths and you can find the most appropriate choice. For example, the PDF version is convenient for download and printing and is easy and convenient for review and learning. It can be printed into papers and is convenient to make notes. You can learn the CAS-004 Test Prep at any time or place and repeatedly practice. The version has no limit for the amount of the persons and times. The PC version of CAS-004 quiz torrent is suitable for the computer with Windows system. It can simulate real operation exam atmosphere and simulate exams.

CompTIA's Exam Questions for CAS-004 Guarantee First Attempt Success and Achieve Your Goals

Many people worry about buying electronic products on Internet, like our CAS-004 preparation quiz, because they think it is a kind of dangerous behavior which may bring some virus for their electronic product, especially for their computer which stores a great amount of privacy information. We must emphasize that our CAS-004 simulating materials are absolutely safe without viruses, if there is any doubt about this after the pre-sale, we provide remote online guidance installation of our CAS-004 exam practice.

CompTIA Advanced Security Practitioner (CASP+) Exam Sample Questions (Q479-Q484):

NEW QUESTION # 479
An organization has severallegacy systemsthat are critical to testing currently deployed assets. These systems have become aserious riskto the organization's security posture, and the securitymanager must implement protection measures to preventcritical infrastructurefrom being impacted. The systems must stayinterconnectedto allow communication with the deployed assets. Which of the following designs, if implemented, wouldddecrease the most risksbut still meet the requirements?

- A. Screened subnet
- B. Air gap
- C. Containerization
- D. Software-defined networking

Answer: A

Explanation:
Comprehensive and Detailed in-Depth Explanation:
Problem Statement:
The organization needs tosecure legacy systemswhile maintaininginterconnectivitywith deployed assets.
Legacy systems are inherentlyvulnerableand canpose risksif directly connected to critical infrastructure.
Thegoalis to minimize risks withoutbreaking connectivity.
Why the Correct Answer is D (Screened Subnet):
Ascreened subnet(often called aDMZ - Demilitarized Zone) is anetwork segmentthat isolates potentially risky systems from theinternal network.
It is typically placedbetween two firewalls:
One firewall separates the DMZ from theexternal network (internet).
The other firewall isolates the DMZ from theinternal network.
This setup allowscontrolled communicationbetween legacy systems and internal assets while minimizing risk.
Key Benefits of a Screened Subnet:
Isolation:Separates legacy systems from the critical internal network.
Controlled Access:Usesfirewall rulesto restrictinbound and outbound traffic.
Reduced Attack Surface:Limits the potential impact of acompromised legacy system.
Interconnectivity Maintenance:Enables communication withdeployed assetswithout direct exposure.
Example Scenario:
A company haslegacy industrial control systems (ICS)that need to interact withmodern monitoring tools.
Placing the ICS within ascreened subnetensures:
Data flow is regulated.
Monitoring systems can still accessICS data without risking full network exposure.
Compromise of thelegacy systemdoes not automatically mean compromise of thecore network.
Why the Other Options Are Incorrect:
A: Software-defined networking (SDN):
SDN enablesdynamic network configuration, but it does not inherentlyisolate risky legacy systems.
While it can segment traffic, it is primarily used fornetwork flexibilityandmanagement, not isolation.
B: Containerization:
Containersisolate applications, but legacy systems often run ondedicated hardware or old OS environmentsthat are not container-compatible.
This approach does not meet the requirement of keeping thesystems interconnected.
C: Air gap:
Anair gapcompletelyisolates systems from any network.
This solutionbreaks interconnectivity, making itimpracticalfor the given requirement.
Ideal forhigh-security environmentsbut not whenintercommunicationis needed.
Real-World Example:
A healthcare organization haslegacy medical devicesthat must communicate with thepatient management system.
Placing these devices in ascreened subnetallows them to interact while beingisolatedfrom thecore hospital network, minimizingcyber risk.

Extract from CompTIA SecurityX CAS-005 Study Guide:
TheCompTIA SecurityX CAS-005 Official Study Guideadvises using ascreened subnet (DMZ)when isolatinglegacy systemsthat still requirenetwork connectivity. The guide emphasizes that this approach significantlyreduces riskby minimizing theattack surfacewhile maintaining necessaryinter-system communication.

NEW QUESTION # 480
A company provides guest WiFi access to the internet and physically separates the guest network from the company's internal WIFI. Due to a recent incident in which an attacker gained access to the compay's intend WIFI, the company plans to configure WPA2 Enterprise in an EAP- TLS configuration. Which of the following must be installed on authorized hosts for this new configuration to work properly?

- A. PKI certificates
- B. Active Directory OPOs
- C. NAC persistent agent
- D. Host-based firewall

Answer: A

NEW QUESTION # 481
A developer is creating a new mobile application for a company. The application uses REST API and TLS 1.2 to communicate securely with the external back-end server. Due to this configuration, the company is concerned about HTTPS interception attacks. Which of the following would be the BEST solution against this type of attack?

- A. Cookies
- B. Wildcard certificates
- C. HSTS
- D. Certificate pinning

Answer: D

Explanation:
Reference:https://cloud.google.com/security/encryption-in-transit
Certificate pinning is a technique that can prevent HTTPS interception attacks by hardcoding the expected certificate or public key of the server in the application code, so that any certificate presented by an intermediary will be rejected. Cookies are small pieces of data that are stored by browsers to remember user preferences or sessions, but they do not prevent HTTPS interception attacks. Wildcard certificates are certificates that can be used for multiple subdomains of a domain, but they do not prevent HTTPS interception attacks. HSTS (HTTP Strict Transport Security) is a policy that forces browsers to use HTTPS connections, but it does not prevent HTTPS interception attacks. Verified References:

NEW QUESTION # 482
A company that all mobile devices be encrypted, commensurate with the full disk encryption scheme of assets, such as workstation, servers, and laptops. Which of the following will MOST likely be a limiting factor when selecting mobile device managers for the company?

- A. Increased network latency
- B. Unavailable of key escrow
- C. Removal of user authentication requirements
- D. Inability to selected AES-256 encryption

Answer: D

Explanation:
The inability to select AES-256 encryption will most likely be a limiting factor when selecting mobile device managers for the company. AES-256 is a symmetric encryption algorithm that uses a 256-bit key to encrypt and decrypt data. It is considered one of the strongest encryption methods available and is widely used for securing sensitive data. Mobile device managers are software applications that allow administrators to remotely manage and secure mobile devices used by employees. However, not all mobile device managers may support AES-256 encryption or allow the company to enforce it as a policy on all mobile devices.

NEW QUESTION # 483
A SaaS startup is maturing its DevSecOps program and wants to identify weaknesses earlier in the development process in order to reduce the average time to identify serverless application vulnerabilities and the costs associated with remediation The startup began its early security testing efforts with DAST to cover public-facing application components and recently implemented a bug bounty program Which of the following will BEST accomplish the company's objectives?

- A. CMS
- B. WAF
- C. SAST
- D. RASP

Answer: C

Explanation:
Static application security testing (SAST) is a method of analyzing the source code of an application for vulnerabilities and weaknesses before it is deployed. SAST can help identify security issues earlier in the development process, reducing the time and cost of remediation. Dynamic application security testing (DAST) is a method of testing the functionality and behavior of an application at runtime for vulnerabilities and weaknesses. DAST can cover public-facing application components, but it cannot detect issues in the source code or in serverless applications. Runtime application self-protection (RASP) is a technology that monitors and protects an application from attacks in real time by embedding security features into the application code or runtime environment. RASP can help prevent exploitation of vulnerabilities, but it cannot identify or fix them. A web application firewall (WAF) is a device or software that filters and blocks malicious web traffic from reaching an application. A WAF can help protect an application from common attacks, but it cannot detect or fix vulnerabilities in the application code or in serverless applications.
