CompTIA PT0-002 Exam is very important because it ensures that a professional is knowledgeable and skilled in the critical area of cybersecurity. With the current state of cyber threats, it is essential for professionals to be well equipped with the necessary skills and knowledge to detect and prevent cyber attacks on their networks. PT0-002 exam is an excellent way to prove a candidate's expertise in identifying and stopping such threats.

CompTIA PenTest+ certification exam (PT0-002) is an industry-recognized certification exam that validates the skills and knowledge of a cybersecurity professional in the field of penetration testing. PT0-002 examination assesses the candidate's ability to plan, conduct, and report on penetration testing projects. PT0-002 exam aims to evaluate a candidate's expertise in vulnerability scanning, enumeration, exploitation, and post-exploitation techniques. The CompTIA PT0-002 certification exam is designed for cybersecurity professionals who want to showcase their skills in penetration testing, network and application security and demonstrate their expertise in ethical hacking.

To pass the CompTIA PT0-002 exam, candidates should have knowledge of the fundamental concepts of cybersecurity, such as network architecture, programming, and operating systems. They should also have hands-on experience with various tools and techniques to perform ethical hacking, penetration testing, and vulnerability assessments. PT0-002 Exam requires candidates to demonstrate their ability to detect and exploit vulnerabilities, document and communicate findings, and provide recommendations for remediation. Passing the exam can open doors for exciting and challenging career opportunities in cybersecurity.

## CompTIA PenTest+ Certification Sample Questions (Q356-Q361):

### NEW QUESTION # 356

A penetration tester ran a simple Python-based scanner. The following is a snippet of the code:

```

...
<LINE NUM.>
<01> portlist: list[int] = [*range(1, 1025)]
<02> try:
<03>     port: object
<04>     resultList: list[Any] = []
<05>     for port in portList:
<06>         sock = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
<07>         sock.settimeout(20)
<08>         result = sock.connect_ex((remoteSvr, port))
<09>         if result == 0:
<10>             resultList.append(port)
<11>         sock.close()
...

```

Which of the following BEST describes why this script triggered a 'probable port scan' alert in the organization's IDS?

- A. The remoteSvr variable has neither been type-hinted nor initialized.
- B. sock.settimeout(20) on line 7 caused each next socket to be created every 20 milliseconds.
- C. **\*range(1, 1025) on line 1 populated the portList list in numerical order.**
- D. Line 6 uses socket.SOCK\_STREAM instead of socket.SOCK\_DGRAM

**Answer: C**

Explanation:

Port randomization is widely used in port scanners. By default, Nmap randomizes the scanned port order (except that certain commonly accessible ports are moved near the beginning for efficiency reasons)

#### NEW QUESTION # 357

Which of the following is a rules engine for managing public cloud accounts and resources?

- A. Pacu
- B. Cloud Brute
- C. Scout Suite
- D. **Cloud Custodian**

**Answer: D**

Explanation:

Cloud Custodian is a rules engine for managing public cloud accounts and resources. It allows users to define policies to enable a well managed cloud infrastructure, that's both secure and cost optimized. It consolidates many of the adhoc scripts organizations have into a lightweight and flexible tool, with unified metrics and reporting.

Cloud Custodian is a tool that can be used to manage public cloud accounts and resources. Cloud Custodian can define policies and rules for cloud resources based on various criteria, such as tags, filters, actions, modes, or schedules. Cloud Custodian can enforce compliance, governance, security, cost optimization, and operational efficiency for cloud resources. Cloud Custodian supports multiple public cloud providers, such as AWS, Azure, GCP, and Kubernetes. Cloud Brute is a tool that can be used to enumerate cloud platforms and discover hidden files and buckets. Pacu is a tool that can be used to exploit AWS environments and perform post-exploitation actions. Scout Suite is a tool that can be used to audit cloud environments and identify security issues.

#### NEW QUESTION # 358

Which of the following types of information would most likely be included in an application security assessment report addressed to developers? (Select two).

- A. **Null pointer dereferences**
- B. Non-compliance with code style guide
- C. Use of non-optimized sort functions
- D. A cyclomatic complexity score of 3
- E. Use of deprecated Javadoc tags
- F. **Poor input sanitization**

**Answer: A,F**

Explanation:

An application security assessment report aimed at developers typically includes information critical to understanding and improving

the security and stability of the application. Poor input sanitization and null pointer dereferences are two such issues that are directly related to application security and can lead to significant vulnerabilities such as injection attacks or crashes. Poor input sanitization exposes the application to various forms of injection attacks, where an attacker could supply malicious input to gain unauthorized access or disrupt application services. Null pointer dereferences, on the other hand, can lead to application crashes or unexpected behavior, which can be exploited to compromise application security or availability. Highlighting these issues helps developers focus on areas that need immediate attention to enhance the application's security posture.

#### NEW QUESTION # 359

A penetration tester attempted a DNS poisoning attack. After the attempt, no traffic was seen from the target machine. Which of the following MOST likely caused the attack to fail?

- A. The DNS cache was not refreshed.
- B. The DNS information was incorrect.
- C. The injection was too slow.
- D. The client did not receive a trusted response.

**Answer: A**

Explanation:

A DNS poisoning attack is an attack that exploits a vulnerability in the DNS protocol or system to redirect traffic from legitimate websites to malicious ones. A DNS poisoning attack works by injecting false DNS records into a DNS server or resolver's cache, which is a temporary storage of DNS information. However, if the DNS cache was not refreshed, then the attack would fail, as the target machine would still use the old and valid DNS records from its cache. The other options are not likely causes of the attack failure.

#### NEW QUESTION # 360

A penetration tester obtained the following results after scanning a web server using the dirb utility:

```
...
GENERATED WORDS: 4612
---- Scanning URL: http://10.2.10.13/ ----
+ http://10.2.10.13/about (CODE:200|SIZE:1520)
+ http://10.2.10.13/home.html (CODE:200|SIZE:214)
+ http://10.2.10.13/index.html (CODE:200|SIZE:214)
+ http://10.2.10.13/info (CODE:200|SIZE:214)
```

```
...
DOWNLOADED: 4612 - FOUND: 4
```

Which of the following elements is MOST likely to contain useful information for the penetration tester?

- A. home.html
- B. about
- C. info
- D. index.html

**Answer: B**
