CompTIA SK0-005 dumps & Testinsides SK0-005 PDF & SK0-005 actual test

P.S. Free 2025 CompTIA SK0-005 dumps are available on Google Drive shared by PDFDumps: https://drive.google.com/open?id=1YNcWfrj0AqhDoqz-zsYsao6LFvx0-FqJ

We prepare everything you need to prepare, and help you pass the exam easily. The SK0-005 exam braindumps of us have the significant information for the exam, if you use it, you will learn the basic knowledge as well as some ways. We offer free update for you, and you will get the latest version timely, and you just need to practice the SK0-005 Exam Dumps. We believe that with the joint efforts of both us, you will gain a satisfactory result.

CompTIA Server+ certification exam is ideal for IT professionals who work in server administration, network administration, system administration, and data center operations. It is also beneficial for individuals who want to advance their careers in IT and increase their earning potential. By earning this certification, professionals can demonstrate their expertise in server technologies, which can open up new job opportunities and career paths.

SK0-005 free pdf demo & SK0-005 training material & SK0-005 exam prep files

Are you upset for your SK0-005 exam test? When you find SK0-005 valid test cram, your stress may be relieved and you may have methods to do the next preparation for SK0-005 actual exam. The CompTIA SK0-005 correct questions & answers are the latest and constantly updated in accordance with the changing of the Real SK0-005 Exam, which will ensure you solve all the problem in the actual test. You will pass your SK0-005 test at first attempt with ease.

CompTIA SK0-005 certification exam is designed to test the knowledge and skills of IT professionals in server administration. SK0-005 exam is divided into different sections, each covering a specific area of server administration. SK0-005 exam is a combination of multiple-choice questions and performance-based questions, which assess your ability to apply your knowledge in real-world scenarios. Passing the exam demonstrates your ability to manage and maintain servers effectively, making you a valuable asset in any IT organization.

CompTIA SK0-005 is a certification exam that is designed to test the knowledge and skills of IT professionals in managing and maintaining server hardware and software. SK0-005 exam is intended for individuals who are responsible for managing and supporting server infrastructure in small, medium, and large enterprises.

CompTIA Server+ Certification Exam Sample Questions (Q203-Q208):

NEW QUESTION # 203

A technician needs to deploy an operating system that would optimize server resources. Which of the following server installation methods would BEST meet this requirement?

- · A. Bare metal
- B. GUI
- C. Core
- D. Full

Answer: C

Explanation:

Explanation

The server installation method that would optimize server resources is core. Core is a minimal installation option that is available for some operating systems, such as Windows Server and Linux. Core installs only the essential components and features of the operating system, without any graphical user interface (GUI) or other unnecessary services or applications. Core reduces the disk footprint, memory usage, CPU consumption, and attack surface of the server, making it more efficient and secure. Core can be managed remotely using command-line tools, PowerShell, or GUI tools.

NEW QUESTION # 204

An administrator has been asked to verify that all traffic egressing from a company is secured. The administrator confirms all the information that is sent over the network is encrypted. Which of the following describes the type of traffic being encrypted?

- A. Secure FTP
- B. Off-site data
- C. Data in transit
- D. Network encapsulation

Answer: C

Explanation:

Explanation

Data in transit is data that is being transferred over a network, such as the internet. It can be encrypted to protect it from unauthorized access or tampering. Verified References: [Data in transit], [Encryption]

NEW QUESTION #205

The network's IDS is giving multiple alerts that unauthorized traffic from a critical application server is being sent to a known-bad public IP address.

One of the alerts contains the following information:

- A) Exploit Alert
- B) Attempted User Privilege Gain
- C) 2/2/07-3: 09:09 10.1.200.32
- D) --> 208.206.12.9:80

This server application is part of a cluster in which two other servers are also servicing clients. The server administrator has verified the other servers are not sending out traffic to that public IP address. The IP address subnet of the application servers is 10.1.200.0/26. Which of the following should the administrator perform to ensure only authorized traffic is being sent from the application server and downtime is minimized? (Select two).

- A. Change the IP address of all the servers in the cluster to the 208,206.12.0/26 subnet.
- B. Disable all services on the affected application server.
- C. Enable GPO to install an antivirus on all the servers and perform a weekly reboot.
- D. Perform an antivirus scan on all servers within the cluster and reboot each server.
- E. Perform a vulnerability scan on all the servers within the cluster and patch accordingly.

• F. Block access to 208.206.12.9 from all servers on the network.

Answer: D,E

Explanation:

The administrator should perform an antivirus scan on all servers within the cluster and reboot each server, and block access to 208.206.12.9 from all servers on the network. These actions will help to remove any malware that may have infected the application server and prevent any further unauthorized traffic to the known-bad public IP address. An antivirus scan can detect and remove malicious software that may be sending data to an external source, and a reboot can clear any temporary files or processes that may be related to the malware. Blocking access to 208.206.12.9 from all servers on the network can prevent any future attempts to communicate with the malicious IP address.

NEW QUESTION #206

A server administrator added a new drive to a server. However, the drive is not showing up as available. Which of the following does the administrator need to do to make the drive available?

- A. Partition the drive.
- B. Set the compression.
- C. Configure the drive as dynamic.
- D. Create a new disk quota.

Answer: A

Explanation:

Explanation: To make a new drive available on a server, the administrator needs to partition the drive first.

Partitioning is a process that divides the drive into one or more logical sections that can be formatted and assigned drive letters or mount points. Partitioning can be done using tools such as Disk Management on Windows or fdisk on Linux. Creating a new disk quota would not help, as disk quotas are used to limit the amount of disk space that users or groups can use on a partition.

Configuring the drive as dynamic would not help either, as dynamic disks are used to create volumes that span multiple disks or use RAID features. Setting the compression would not help, as compression is used to reduce the size of files on a partition. NEW QUESTION #207

An administrator is troubleshooting performance issues on a server that was recently upgraded. The administrator met with users/stakeholders and documented recent changes in an effort to determine whether the server is better or worse since the changes. Which of the following would BEST help answer the server performance question9

- A. A hardware compatibility list
- B. Server performance thresholds
- C. An application service-level agreement
- D. A server baseline

Answer: D

Explanation:

A server baseline is a set of metrics that represents the normal performance and behavior of a server under a specific workload and configuration. A server baseline can help answer the server performance question by comparing the current performance with the previous performance before the upgrade. This can help identify any changes or issues that may have affected the server performance.
