Answer: B

Explanation:

Explanation

BGP EVPN is a control plane protocol that can be used for VXLAN networks. VXLAN is a technology that creates overlay networks to extend Layer 2 connectivity across Layer 3 networks. BGP EVPN has the following functions as a VXLAN control plane protocol:

It automatically establishes the VXLAN tunnel between VTEPs (VXLAN Tunnel Endpoints), which are devices that encapsulate and decapsulate VXLAN packets. You do not need to manually configure a full-mesh tunnel between all VTEPs, which reduces the configuration complexity and improves the scalability.

It advertises host routes and MAC address entries on the control plane, which are used to learn the location of hosts and their corresponding VTEPs. This reduces the unknown traffic flooding that occurs when the destination MAC address is unknown, and optimizes the packet forwarding by using optimal paths.

It implements Layer 2 interconnection between data centers in different networking modes, such as bridging, routing, or integrated routing and bridging (IRB). This enables seamless communication between hosts in different subnets or VLANs across data centers.

It advertises subnet routes to implement Layer 3 interconnection of data centers through VXLAN tunnels. This enables routing between different subnets or VLANs across data centers without requiring an external gateway device.
