Salesforce Certified Platform Developer I Sample Questions (Q166-Q171):

NEW QUESTION # 166

What are two considerations for deploying from a sandbox to production? Choose 2 answers

- A. All triggers must have at least one line of test coverage.
- B. At least 75% of Apex code must be covered by unit tests.
- C. Unit tests must have calls to the System.assert method.
- D. Should deploy during business hours to ensure feedback can be quickly addressed.

Answer: A,B

Explanation:

When deploying Apex code to production, the following considerations are required:

Option B: All triggers must have at least one line of test coverage.

Salesforce mandates that every trigger has some test coverage.

Salesforce requires that 75% of your Apex code is covered by tests.

Reference:

"All Apex code must have 75% test coverage, and all triggers must have some test coverage in order to be deployed to production."

- Salesforce Help: Deployment Testing Requirements

Option C: At least 75% of Apex code must be covered by unit tests.

"At least 75% of your Apex code must be covered by unit tests, and all of those tests must complete successfully."

- Salesforce Help: Deployment Testing Requirements

Why Other Options Are Incorrect:

Option A: Deploying during business hours is not a technical requirement and may not be best practice due to potential impact on users.

Option D: While using System.assert is good practice, it's not a strict requirement for deployment.

NEW QUESTION # 167

A developer executes the following code in the Developer Console:

```
List<Account> fList = new List<Account> ();
For(integer i = 1; i <= 200; i++){fList.add(new Account ( Name = 'Universal
Account ' + i));}
Insert fList;
List<Account> sList = new List<Account>();
For (integer I = 201; I <=
```

20000; i++){sList.add(new Account (Name = 'Universal Account ' + i));} Insert sList;How many accounts are created in the Salesforce organization ?

- A. 0
- B. 1
- C. 2
- **D. 3**

Answer: D

NEW QUESTION # 168

Which statement should be used to allow some of the records in a list of records to be inserted if others fail to be inserted?

- A. Insert(records, false)
- B. insert records
- **C. Database.insert(records, false)**
- D. Database.insert(records, true)

Answer: C

Explanation:

To allow partial success when inserting a list of records, the developer should use the Database class methods with the allOrNone parameter set to false.

Option B: Database.insert(records, false)

Correct Answer.

The Database.insert() method allows for partial processing.

By setting the second parameter (allOrNone) to false, the operation will attempt to insert all records.

If some records fail, the successful ones will be committed, and the errors can be examined from the result.

Usage:

```
Database.SaveResult[] results = Database.insert(records, false);
for (Database.SaveResult sr : results) {
    if (sr.isSuccess()) {
        // Record inserted successfully
    } else {
        // Handle errors
        for (Database.Error err : sr.getErrors()) {
            System.debug(err.getMessage());
        }
    }
}
```

The insert statement does not allow partial success; it operates with allOrNone set to true by default.

If any record fails, the entire operation is rolled back.

Option C: Insert(records, false)

Incorrect Syntax.

The insert keyword cannot take parameters.

The correct method with parameters is Database.insert().

Option D: Database.insert(records, true)

Incorrect.

Setting allOrNone to true (default behavior) means that if any record fails, the entire transaction is rolled back.

Conclusion:

To allow partial inserts when some records fail, use Database.insert(records, false), which is Option B.

Incorrect Options:

Option A: insert records

Incorrect.

NEW QUESTION # 169

A developer is tasked to perform a security review of the ContactSearch Apex class that exists in the system. Within the class, the

developer identifies the following method as a security threat:

```
ist<Contact> performSearch (String lastName) {  
return Database.query("SELECT Id, FirstName, LastName FROM Contact WHERE LastName Like s'+lastName+'s'");  
};
```

What are two ways the developer can update the method to prevent a SOQL injection attack?
Choose 2 answers

- A. Use the Readonly annotation and the with sharing keyword on the class.
- B. Use a regular expression on the parameter to remove special characters.
- C. Use variable binding and replace the dynamic query with a static SOQL.
- D. Use the escapeSingleQuotes method to sanitize the parameter before its use.

Answer: A,B

NEW QUESTION # 170
