## ISTQB CT-PT Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>Common Failures in Performance Testing and Their Causes: This section of the exam measures the skills of Performance Engineers and outlines frequent failure modes, including slow responses at various load levels, degraded performance over time, and system crashes under peak conditions. It provides examples of underlying causes such as resource leaks, insufficient capacity, and poor handling of spikes or concurrency, illustrating why robust planning and monitoring are crucial for reliable performance.</li></ul>

Topic 2	<ul style="list-style-type: none"> <li>• The Concept of Load Generation: This section of the exam measures the skills of Software Test Analysts and discusses how representative loads are modeled and produced to simulate user or process behavior. It explores methods such as user interface inputs, crowdsourcing, API-based calls, or protocol capture and playback, emphasizing the need for repeatable loads that accurately reflect real-world conditions.</li> </ul>
Topic 3	<ul style="list-style-type: none"> <li>• Types of Performance Testing: This section of the exam measures the skills of Software Test Analysts and covers various approaches such as load, stress, scalability, spike, endurance, concurrency, and capacity testing. It explains how each type evaluates system behavior under different conditions, helping testers and stakeholders understand how the system handles both expected and extreme usage scenarios.</li> </ul>
Topic 4	<ul style="list-style-type: none"> <li>• Testing Types in Performance Testing: This section of the exam introduces the distinction between static and dynamic performance testing. It shows how reviews of requirements, architecture, and code can identify risks before coding is complete, and how runtime checks of resource utilization and response times reveal issues that only appear when the system is in operation.</li> </ul>

## ISTQB Certified Tester - Performance Testing Sample Questions (Q40-Q45):

### NEW QUESTION # 40

Which of the following is a typical performance risk associated with distributed architectures?

- A. A local hard disk that has been de-fragmented
- B. Unreliable or unpredictable remote servers
- C. Excess computer memory resources
- D. Inconsistent Bluetooth connectivity

**Answer: B**

Explanation:

A key risk in distributed systems is unreliable remote servers, which can lead to latency, timeouts, and failures in performance testing. Option A (Hard disk de-fragmentation) is not a significant risk in distributed systems. Option B (Excess memory) is a positive factor, not a risk. Option D (Bluetooth connectivity) is unrelated to distributed system performance.

### NEW QUESTION # 41

During which of the principal performance testing activities are the building blocks for larger, more complex tests created?

- A. During test completion
- B. During test implementation
- C. During test planning
- D. During test design

**Answer: B**

Explanation:

Test implementation is the stage where smaller test components are created and assembled into larger test scenarios. This phase includes scripting, test data preparation, and configuring load profiles. Option A (Test completion) involves analyzing results, not building tests. Option B (Test planning) focuses on strategies and objectives, not test creation.

Option C (Test design) defines test scenarios and cases, but the actual building happens in implementation.

#### NEW QUESTION # 42

You are heading the testing effort for a system that manages the air/fuel ratio of direct-injection fuel devices built specifically for high-altitude rescue helicopter engines. At altitude, the system must be able to perform in order to make enough air/fuel ratio adjustments per millisecond between fuel and both an on-board source and available ambient air in order to prevent an engine stall due to oxygen starvation. The system is following a sequential development lifecycle.

For this safety-critical software, when is the appropriate point in the lifecycle to identify and define the performance goals?

- A. After test readiness has been achieved, but before system testing starts
- B. At the very beginning of the project during the concept stage
- C. During the requirements phase when the business stakeholders have the opportunity to agree
- D. During the software design phase when the requirements are set and the design is being defined

**Answer: C**

Explanation:

For safety-critical software, performance goals must be identified as early as the requirements phase. This ensures that performance constraints are well understood and accounted for throughout development.

Option A (After test readiness but before system testing) is too late, as requirements should be defined before coding begins.

Option C (During the concept stage) is too early, as details may not be concrete.

Option D (During software design) is useful but should be preceded by a proper definition during the requirements phase.

#### NEW QUESTION # 43

Which of the following is a typical performance risk associated with mobile, browser-based, and embedded real-time architectures?

- A. Unexpected loads due to API accessibility
- B. Slow hard disk speed
- C. Misconfigured host machine
- D. Internet connectivity issues

**Answer: A**

Explanation:

Mobile and browser-based applications often rely on APIs for data retrieval and processing. Unexpected API load can cause latency issues, bottlenecks, and system crashes.

Option A (Hard disk speed) is not a major issue in cloud-based or mobile systems.

Option B (Misconfigured host machine) affects on-premise systems, not mobile/browser-based applications.

Option D (Internet connectivity issues) is a user-side issue, not a system performance risk.

#### NEW QUESTION # 44

Which of the following is the most economical solution to minimize costs and time for performance testing for a high-end production client-server platform?

- A. Cloud-based environment
- B. Isolated lab environment
- C. No environment
- D. Mainframe environment

**Answer: A**

Explanation:

A cloud-based environment is the most cost-effective solution for performance testing. It offers scalability, pay-per-use models, and flexibility, allowing testers to simulate large workloads without expensive infrastructure investments.

Option A (Isolated lab environment) is costly due to hardware maintenance and infrastructure costs.

Option C (Mainframe environment) is expensive and impractical for performance testing.

Option D (No environment) is not a viable option.
