Our company is professional brand established for compiling CTFL4 exam materials for candidates, and we aim to help you to pass the examination as well as getting the related certification in a more efficient and easier way. Owing to the superior quality and reasonable price of our CTFL4 Exam Materials, our company has become a top-notch one in the international market. So you can totally depend on our CTFL4 exam torrents when you are preparing for the exam. If you want to be the next beneficiary, just hurry up to purchase.

BCS ISTQB Certified Tester Foundation Level CTFL 4.0 Sample Questions (Q184-Q189):

NEW QUESTION # 184

Select the roles required in a formal review:

- A. Author, Business analyst, Facilitator, Review Leader, Reviewers, Scribe
- **B. Author, Management, Facilitator, Review Leader, Reviewers, Scribe**
- C. Author, Developer, Facilitator, Review Leader, Reviewers, Scribe
- D. Author, Tester, Facilitator, Review Leader, Reviewers, Scribe

Answer: B

Explanation:

In a formal review, the roles involved typically include the author, management, facilitator (also known as moderator), review leader, reviewers, and scribe. Each role has specific responsibilities to ensure the effectiveness and efficiency of the review process:

The author creates and refines the work product being reviewed.

Management allocates resources and supports the review process.

The facilitator manages the review meeting, ensuring it proceeds smoothly.

The review leader plans the review and ensures it meets its objectives.

Reviewers examine the work product to identify defects.

The scribe records issues raised during the review meeting.

NEW QUESTION # 185

Which ONE of the following elements is TYPICALLY used to guide testing during exploratory testing?

- A. A detailed test script that prescribes all the steps to be performed.
- **B. A test charter that defines the testing objectives for the test session.**
- C. A comprehensive specification that must be fully available before testing begins.
- D. A predefined test case that must be executed exactly as documented.

Answer: B

Explanation:

Comprehensive and Detailed In-Depth Explanation: Exploratory testing is an unscripted approach where testers actively design and execute tests based on their intuition, experience, and knowledge of the system. A test charter (A) provides a guideline on what areas to explore, defining test objectives but leaving room for dynamic adaptation.

* (B), (C), and (D) contradict exploratory testing principles, which focus on freedom rather than rigid documentation.

* Exploratory testing is especially useful in agile environments, usability testing, and uncovering unexpected defects.

NEW QUESTION # 186

Which of the following statements is true?

- **A. Experience-based test techniques are often useful to detect hidden defects that have not been targeted by black-box test techniques**
- B. Some of the most common test basis used by white-box test techniques include user stories, use cases and business processes
- C. Experience-based test techniques rely on the experience of testers to identify the root causes of defects found by black-box test techniques
- D. The primary goal of experience-based test techniques is to design test cases that can be easily automated using a GUI-based test automation tool

Answer: A

Explanation:

Experience-based test techniques are test design techniques that rely on the experience, knowledge, intuition, and creativity of the testers to identify and execute test cases that are likely to find defects in the software system. Experience-based test techniques are often useful to detect hidden defects that have not been targeted by black-box test techniques, which are test design techniques that use the external behavior and specifications of the software system as the test basis, without considering its internal structure or implementation. Experience-based test techniques can complement black-box test techniques by covering aspects that are not explicitly specified, such as usability, security, reliability, performance, etc. The other statements are false, because:

* Experience-based test techniques do not rely on the experience of testers to identify the root causes of defects found by black-box test techniques, but rather to identify the potential sources of defects based on their own insights, heuristics, or exploratory testing. The root causes of defects are usually identified by debugging or root cause analysis, which are activities that involve examining the code or the development process to find and fix the errors that led to the defects.

* Some of the most common test basis used by white-box test techniques include the source code, the design documents, the architecture diagrams, and the control flow graphs of the software system. White-box test techniques are test design techniques that use the internal structure and implementation of the software system as the test basis, and aim to achieve a certain level of test coverage based on the code elements, such as statements, branches, paths, etc. User stories, use cases, and business processes are examples of test basis used by black-box test techniques, as they describe the functional and non-functional requirements of the software system from the perspective of the users or the stakeholders.

* The primary goal of experience-based test techniques is not to design test cases that can be easily automated using a GUI-based test automation tool, but rather to design test cases that can reveal defects that are not easily detected by other test techniques, such as boundary value analysis, equivalence partitioning, state transition testing, etc. Test automation is the use of software tools to execute test cases and compare actual results with expected results, without human intervention. Test automation can be applied to different types of test techniques, depending on the test objectives, the test levels, the test tools, and the test resources. However, test automation is not always feasible or beneficial, especially for test cases that require human judgment, creativity, or exploration, such as those designed by experience-based test techniques. NEW QUESTION # 187

Which ONE of the following options MOST ACCURATELY describes statement testing?

- A. In statement testing, the coverage items are control flow transfers between branches. The aim is to design test cases to exercise branches in the code until an acceptable level of coverage is achieved, expressed as a percentage.
- B. In statement testing, the coverage items are decisions and statements. The aim is to design test cases that exercise statements in the code until an acceptable level of coverage is achieved, expressed as a percentage.
- C. In statement testing, the coverage items are branches, and the aim is to design test cases to exercise branches in the code until an acceptable level of coverage is achieved, expressed as a percentage.
- D. In statement testing, the coverage items are executable statements. The aim is to design test cases that exercise statements in the code until an acceptable level of coverage is achieved, expressed as a percentage.

Answer: D

Explanation:

Comprehensive and Detailed In-Depth Explanation: Statement testing aims to execute every executable statement in the source code at least once.

* (D) is correct as statement testing ensures maximum statement execution.

* (A) describes branch testing, which focuses on flow transfers.

* (B) and (C) incorrectly mix decision testing and branch testing concepts.

NEW QUESTION # 188

Testing Quadrants, as a model, is effective in aligning stakeholders within Agile teams.

Which of the following examples demonstrates this?

- A. Using Testing Quadrant, the test manager is able to prioritize defects by linking these to a specific type of test.

- B. Using Testing Quadrants, the test manager is able to differentiate and describe the types of tests to all stakeholders.
- C. Using Testing Quadrants, the test manager is able to communicate potential product risk to all stakeholders.
- D. Using Testing Quadrants, the test manager is able to measure and communicate test coverage to all stakeholders.

Answer: B

Explanation:

The Testing Quadrants model helps Agile teams by categorizing different types of tests and their purposes. This differentiation helps test managers explain the testing strategy to all stakeholders, ensuring everyone understands the scope and objectives of each test type. This model aids in planning, executing, and tracking testing activities across different quadrants, making it easier to align with stakeholders' expectations and project goals.
