CompTIA Cloud+ Certification Exam Sample Questions (Q438-Q443):

NEW QUESTION # 438

A company is planning its cloud architecture and wants to use a VPC for each of its three products per environment in two regions, totaling 18 VPCs. The products have interdependences, consuming services between VPCs. Which of the following should the cloud architect use to connect all the VPCs?

- A. MPLS connections
- B. VPC peering
- C. VPN connections
- D. Hub and spoke

Answer: D

Explanation:

Explanation

The best way to connect all the VPCs for the company that is planning its cloud architecture and wants to use a VPC for each of its three products per environment in two regions, totaling 18 VPCs, is to use a hub and spoke model. A hub and spoke model is a networking model that uses a central hub VPC that connects to multiple spoke VPCs that host the products or workloads. The hub VPC can provide common services and security policies for the spoke VPCs, such as network virtual appliances, DNS servers, firewalls, or VPN gateways. The spoke VPCs can communicate with each other through the hub VPC, using private IP addresses or peering connections. A hub and spoke model can simplify the management and scalability of the network, as well as reduce the costs and complexity of peering multiple VPCs directly. NEW QUESTION # 439

A cloud administrator wants to apply patches in an isolated copy of the production virtual server to assess the impact. Which of the following activities would BEST achieve this objective?

- A. Image backup
- **B. Snapshot**
- C. Cloning
- D. Clustering

Answer: B

NEW QUESTION # 440

In an existing IaaS instance, it is required to deploy a single application that has different versions. Which of the following should be recommended to meet this requirement?

- A. Install a Type 2 hypervisor
- B. Create snapshots
- C. Enable SR-IOV on the host
- **D. Deploy using containers**

Answer: D

Explanation:

Containers are a type of deployment technology that packages an application and its dependencies into a lightweight and portable unit that can run on any platform or environment. Containers can help deploy a single application that has different versions in an existing IaaS instance, as they can isolate and run multiple versions of the same application without any conflicts or interference. Containers can also enable faster and easier deployment, scaling, and management of cloud-based applications. Reference: CompTIA Cloud+ Certification Exam Objectives, page 11, section 1.6

NEW QUESTION # 441

After deploying new VMs, the systems administrator notices it is not possible to connect to them using network credentials; however, local accounts work. After logging in, the administrator notices the NTP servers are not set. Which of the following is MOST likely causing this issue?

- A. Directory services requires the use of NTP servers.
- **B. There is a time synchronization issue.**
- C. The VMs are insufficiently licensed.
- D. There is a directory services outage.

Answer: B

NEW QUESTION # 442

An organization is running a database application on a SATA disk, and a customer is experiencing slow performance most of the

Which of the following should be implemented to improve application performance?

- Answer: C**

Upgrading the environment and using solid state drives (SSDs) can improve application performance for a database application that is running on a serial advanced technology attachment (SATA) disk and experiencing slow performance most of the time. Upgrading the environment can involve updating or replacing the hardware, software, or network components that support the application to enhance their functionality, capacity, or compatibility. Using SSDs can provide faster and more reliable data access and storage than SATA disks, as they use flash memory instead of spinning disks to store data. SSDs can also reduce latency, power consumption, and heat generation. References: CompTIA Cloud+ Certification Exam Objectives, page 9, section 1.4
