NEW QUESTION # 52

The To DS bit is set to 0 and the From DS is set to 1.
What best describes this 802.11 frame?

- A. A frame being transmitted from a client STA to an AP
- B. A frame being transmitted directly from one client STA to another
- C. A frame being transmitted in a mesh BSS
- D. A frame being transmitted from an AP to a client STA

Answer: D

NEW QUESTION # 53

Where, in a protocol analyzer, would you find an indication that a frame was transmitted as part of an A-MPDU?

- A. A-MPDU flag in the QoS Control Field
- B. The HT Operation Element
- **C. The Aggregation flag in the Radio Tap Header**
- D. A-MPDU flag in the Frame Control Field

Answer: C

Explanation:

In a protocol analyzer, you would find an indication that a frame was transmitted as part of an A-MPDU by looking at the Aggregation flag in the Radio Tap Header. The Radio Tap Header is a pseudo-header that is added by some wireless capture devices to provide additional information about the physical layer characteristics of a frame. The Aggregation flag is one of the fields in this header, and it indicates whether the frame belongs to an A-MPDU or not. If the flag is set to 1, it means that the frame is part of an A-MPDU; if it is set to 0, it means that the frame is not part of an A-MPDU. NEW QUESTION # 55

Which one of the following is not a valid acknowledgement frame?

- A. Ack
- B. Block Ack
- C. CTS
- **D. RTS**

Answer: D

Explanation:

RTS is not a valid acknowledgement frame. RTS stands for Request To Send, and it is a control frame that is used to initiate an RTS/CTS exchange before sending a data frame. The purpose of an RTS/CTS exchange is to reserve the medium for a data transmission and avoid collisions with hidden nodes. An acknowledgement frame is a control frame that is used to confirm the successful reception of a data frame or a block of data frames. The valid acknowledgement frames are CTS (Clear To Send), Ack (Acknowledgement), and Block Ack (Block Acknowledgement). NEW QUESTION # 56

A client is operating in an unstable RF environment. Out of five data frames transmitted to the client it only receives four. The client sends a Block Ack to acknowledge the receipt of these four frames but due to frame corruption the Block Ack is not received by

the AP. Which frames will be retransmitted'

- A. Both the corrupted data and Block Ack
- B. Only the Block Ack
- C. Only the data frame which was corrupted
- **D. All data frames**

Answer: D

Explanation:

All data frames will be retransmitted in this scenario. This is because the AP uses a Block Ack (BA) mechanism to acknowledge the receipt of multiple data frames from a client in a single frame. The BA contains a bitmap that indicates which data frames were received correctly and which were not. If the BA is not received by the AP due to frame corruption, the AP will assume that none of the data frames were received by the client and will retransmit all of them. The other options are not correct, as they do not account for the loss of the BA or the use of the bitmap.
