CompTIA SecAI+ Certification Exam Sample Questions (Q64-Q69):

NEW QUESTION # 64

What control reduces the impact radius when a single host is compromised?

- A. Network segmentation
- B. Redaction
- C. Tokenization
- D. Obfuscation

Answer: A

Explanation:

Segmentation isolates systems and limits lateral movement.

NEW QUESTION # 65

Which of the following should an auditor reference when reviewing a company's human resources AI systems for legal non-compliance?

- A. Organization for Economic Cooperation and Development (OECD) standard
- B. European Union (EU) AI Act
- C. International Organization for Standardization (ISO)
- D. National Institute of Standards and Technology (NIST) AI Risk Management Framework 9RMF)

Answer: B

Explanation:

The EU AI Act is legally binding legislation that specifically governs the use of AI systems, including those used in human resources for hiring, promotion, and evaluation. An auditor reviewing AI systems for legal non-compliance must reference this act because it establishes enforceable requirements related to transparency, bias, risk classification, and prohibited practices.

NEW QUESTION # 66

An administrator, who works for a financial institution, is required to implement data security controls for data at rest within AI systems that involve data disclosure. Which of the following is the most suitable control?

- A. Rate limits
- B. Data lineage
- C. Masking
- D. Encryption

Answer: D

Explanation:

For financial institutions handling AI systems, protecting data at rest against disclosure requires encryption. Encryption ensures that even if the storage medium is accessed or compromised, the data remains unreadable without the proper decryption keys.

NEW QUESTION # 67

Which of the following is required first in order to send a prompt query and response in a language model (LLM) system when authentication is enabled?

- A. Endpoint access control
- B. Application programming interface gateway
- C. Back-end access gateway
- D. Front-end web proxy gateway

Answer: A

Explanation:

When authentication is enabled, the first requirement for sending a prompt query and receiving a response is endpoint access control. It ensures only authenticated and authorized users or systems can interact with the LLM endpoint.

NEW QUESTION # 68

A penetration tester is assessing the controls of a deployed AI system that is designed to search and return the contents of files. The tester runs the following:

```
#!/usr/bin/env python3
import requests
cmd = ['deleteBuckets', 'getObjects', 'listAcl', 'listPermissions']
url = 'https://myapp.local.dev/locate?file_id="foo.txt";param_1='
count = 0

for i in cmd:
    response = requests.get(url + i)
    if '200' in response:
        #print(str(response))
        count = count + 1
print(## + ' ' + count + ' ' + ##)
```

SCRIPT OUTPUT: ## 4 ##

Which of the following is the best control to prevent abuse of the system?

- A. Adding a large language model (LLM) guardrails library to the application code
- B. Segmenting the workload into a separate virtual private cloud (VPC)
- **C. Reducing the privilege scope of the service account**
- D. Implementing custom detection rules for anomalous model behavior

Answer: C

Explanation:

The penetration test shows that the system accepts arbitrary commands like deleteBuckets or listPermissions, which could lead to privilege abuse. The most effective control is least privilege, ensuring the service account only has access to what is strictly necessary (e.g., reading files) and not sensitive operations like deleting buckets or altering permissions.
