EMC Dell Information Storage and Management Foundations v2 Exam Sample Questions (Q55-Q60):

NEW QUESTION # 55

Question:

Refer to the Exhibit:

Identify the following FC Frame fields:

- A. 1: Frame header, 2: CRC, 3: Data field
- B. 1: CRC, 2: Data field, 3: Frame header
- C. 1: CRC, 2: Frame header, 3: Data field

- D. 1: Frame header, 2: Data field, 3: CRC

Answer: D

Explanation:

Full Detailed Explanation with Step by Step Solutions:

A standard Fibre Channel (FC) frame consists of several fields in a specific order. The typical sequence for an FC data frame is:

1##Frame header: Contains control and addressing information.

2##Data field: Carries the actual payload (up to 2112 bytes).

3##CRC (Cyclic Redundancy Check): Ensures data integrity of the frame.

The diagram in the exhibit shows exactly this ordering:

* SOF (Start of Frame)- marks the beginning of the frame.

* 1 (Frame header)- the control and addressing info.

* 2 (Data field)- the main data payload.

* 3 (CRC)- for error checking.

* EOF (End of Frame)- marks the end of the frame.

NEW QUESTION # 56

Match each OSD (Object Storage Device) feature with its description:

OSD Features	Description	
Flexible data access method	Drives data placement and protection based on the service requirements	
Metadata-driven policy	Abstracts storage from the application and provides a common view independent of location	
Data protection	Supports REST/SOAP APIs and the file sharing protocols, CIFS and NFS, for file services	
Global namespace	Global distribution of objects using either replication or erasure coding	

Answer:

Explanation:

Global namespace	Abstracts storage from the application and provides a common view independent of location

#Flexible data access method: Object storage can offer multiple ways to access and interact with stored data, such as REST/SOAP APIs (for object-based access) and file-sharing protocols (CIFS, NFS) for file-level access.

#Metadata-driven policy: Object storage uses rich metadata to define how objects are placed, protected, and managed, driven by policies that respond to service-level requirements.

#Data protection: Object storage systems implement data protection at a global scale through replication or erasure coding to ensure data durability and availability.

#Global namespace: Object storage abstracts physical locations, providing a single namespace (a unified view) so that applications can seamlessly access data regardless of where it physically resides.

NEW QUESTION # 57

Question:

An organization needs to adhere to compliance and lower the cost of the primary storage. What process should they implement?

- A. Data compression
- B. Data backup
- C. Data archiving
- D. Data encryption

Answer: C

Explanation:

Data archiving involves moving infrequently accessed data to a separate storage system, freeing up space on primary storage and reducing costs. It also aids in compliance by retaining data for specified periods, as required by various regulations.

* Data backup: Creates copies of data for recovery purposes but doesn't necessarily reduce primary storage usage.

* Data archiving: Moves less frequently accessed data to cost-effective storage, aiding compliance and reducing primary storage costs.

* Data encryption: Secures data but doesn't impact storage costs or compliance retention.

* Data compression: Reduces data size but may not meet compliance requirements for data retention.

NEW QUESTION # 58

Question:

What is a read miss in cache operations?

- A. Writing data to the cache
- B. Deleting data from the cache
- C. Fetching requested data that is already in cache
- D. Fetching data that is not in cache

Answer: D

Explanation:

A read miss occurs when the data requested by the host is not available in the cache. As a result, the storage system must fetch the data from the slower disk storage (back-end), leading to higher latency.

* Cache hit: Data is already in cache # faster response.

* Cache miss (read miss): Data not in cache # fetched from the disk.

NEW QUESTION # 59

Question:

What describes an incident in a storage infrastructure?

- **A. Unknown root cause of one or more disruptions to service**
- B. Any event that prevents corrections of known errors
- C. Any action that may impact the functionality of the system
- D. Support request to help access an IT resource

Answer: A

Explanation:

An incident is an unplanned disruption of a service or a reduction in its quality, often with an unknown root cause.

Incidents require immediate action to restore service.

Example: SAN switch port down, unexpected storage latency.

* Support requests are typically service requests, not incidents.

* Impact actions are more about changes, not incidents.

* Events preventing corrections might be problems, not incidents.
