# D-PWF-OE-00 Exam Torrent & D-PWF-OE-00 Actual Test & D-PWF-OE-00 Pass Rate

The aim of DumpsTorrent is to support you in passing the EMC D-PWF-OE-00 certification exam. DumpsTorrent present actual EMC D-PWF-OE-00 practice test questions for you. The world's skilled professionals share their best knowledge with DumpsTorrent and create this set of actual Dell PowerFlex Operate Exam D-PWF-OE-00

The D-PWF-OE-00 study guide to good meet user demand, will be a little bit of knowledge to separate memory, but when you add them together will be surprised to find a day we can make use of the time is so much debris. The D-PWF-OE-00 exam prep can allow users to use the time of debris anytime and anywhere to study and make more reasonable arrangements for their study and life. Choosing our D-PWF-OE-00 simulating materials is a good choice for you, and follow our step, just believe in yourself, you can do it perfectly!

EMC D-PWF-OE-00 Exam Dumps - Key To Getting Success

The DumpsTorrent is committed from the day first to ace the Dell PowerFlex Operate Exam (D-PWF-OE-00) exam questions preparation at any cost. To achieve this objective DumpsTorrent has hired a team of experienced and qualified D-PWF-OE-00 certification exam experts. They utilize all their expertise to offer top-notch Dell PowerFlex Operate Exam (D-PWF-OE-00) exam dumps. These EMC D-PWF-OE-00 exam questions are being offered in three different but easy-to-use formats.

EMC Dell PowerFlex Operate Exam Sample Questions (Q52-Q57):

NEW QUESTION # 52
What is the primary purpose of enabling Maintenance Mode on a PowerFlex node?

- A. To isolate the node for network troubleshooting without impacting data availability
- B. To add new nodes to the cluster
- C. To perform software upgrades or hardware maintenance
- D. To protect volumes using snapshots

Answer: C

Explanation:
In Dell PowerFlex, Maintenance Mode is a critical operational state used primarily when a node requires software upgrades, firmware patches, or physical hardware replacement. When a Storage Data Server (SDS) requires maintenance, it cannot simply be powered down, as this would cause a rebuild of data to restore redundancy, placing immense stress on the cluster.
There are two types of maintenance modes:
* Protected Maintenance Mode (PMM): This is the standard method for planned maintenance. The system identifies the data residing on the target node and makes a temporary copy (mesh-mirrors) of that data onto other nodes in the cluster before the node enters maintenance. This ensures that the cluster maintains full data protection (usually 2 copies) even while the node is offline.
* Instant Maintenance Mode (IMM): This is used when time is critical, or the node is already offline. It acknowledges the node is down but does not trigger a full rebuild immediately, relying on the remaining copy of data.
Therefore, the specific purpose is to allow administrators to perform necessary software upgrades or hardware swaps in a controlled manner that manages data integrity and prevents unnecessary "storm" traffic from rebuilding data.

NEW QUESTION # 53
What are the benefits of enabling Maintenance Mode on a PowerFlex node? (Choose two).

- A. Isolates the node for troubleshooting
- B. Automatically replicates data to other nodes
- C. Enables faster deduplication processes
- D. Allows for node hardware upgrades without disrupting operations

Answer: B,D

Explanation:
This question refers specifically to Protected Maintenance Mode (PMM), which is the standard operational procedure for node maintenance.
* Allows for node hardware upgrades without disrupting operations (Option A): This is the primary business benefit. By placing a node in PMM, you can power it down to replace a failed DIMM, upgrade a CPU, or update firmware. The cluster continues to serve I/O to applications without downtime.
* Automatically replicates data to other nodes (Option B): This is the technical mechanism that makes PMM safe. When PMM is requested, the PowerFlex system identifies the data chunks residing on that node. It proactively copies (mesh-mirrors) that data to other available nodes in the cluster before the node is allowed to go offline. This ensures that even while the node is down for maintenance, the cluster retains full data redundancy (usually 2 copies).
Option C is a side effect but not the primary "benefit" compared to data safety. Option D is incorrect; maintenance mode consumes resources for rebalancing/replication and does not speed up deduplication.

NEW QUESTION # 54
Which tasks are automated when configuring snapshots in PowerFlex? (Choose two).

- A. Scheduling snapshot creation
- B. Automating snapshot replication
- C. Managing snapshot retention policies
- D. Assigning snapshots to fault sets

Answer: A,C

Explanation:
These tasks are handled by the Snapshot Policy feature in PowerFlex.
* Scheduling snapshot creation (Option A): Administrators can define a policy (e.g., "Gold Policy") that triggers a snapshot every 15 minutes. Once applied to a volume, the system automates this trigger.
* Managing snapshot retention policies (Option C): The policy also dictates the lifecycle of the snapshot. For example, "Keep 10 hourly snapshots and 5 daily snapshots." As new snapshots are created, the system automatically deletes the oldest ones to free up space and maintain the defined retention count.
Incorrect Options:
* Assigning to Fault Sets (B): Snapshots reside in the same Storage Pool as the source volume; they are not assigned to Fault Sets.
* Automating replication (D): While replication uses snapshots, the Snapshot Policy feature itself is distinct from the Replication Consistency Group configuration.

NEW QUESTION # 55
What is the primary purpose of PowerFlex Manager?

- A. Automate deployment and lifecycle management
- B. Manage virtual machines
- C. Configure fault sets
- D. Create snapshots of storage volumes

Answer: A

Explanation:
PowerFlex Manager (PFxM) is the orchestration and automation appliance.
* Automate deployment and lifecycle management (Option B): PFxM is designed to take bare-metal servers and automatically deploy the OS, networking, and PowerFlex software to build a cluster. Once built, it handles the Lifecycle Management (LCM), automating complex tasks like firmware upgrades, software patches, and node expansions without downtime.
Incorrect Options: Managing VMs (A) is for vCenter. Creating snapshots (C) and configuring Fault Sets (D) are storage tasks performed via the PowerFlex GUI/Block Controller, whereas PFxM focuses on the infrastructure lifecycle.

NEW QUESTION # 56
What are the considerations for configuring new Metadata Managers during cluster expansion? (Choose two).

- A. Maintain redundancy for metadata storage
- B. Ensure even distribution of metadata across nodes
- C. Validate replication protocols between clusters
- D. Assign the new nodes to an existing Fault Set

Answer: A,B

Explanation:
The Metadata Manager (MDM) cluster is the critical control plane of PowerFlex.
* Maintain redundancy for metadata storage (Option D): The MDM cluster (typically 3 or 5 nodes) must always maintain a quorum. When reconfiguring or expanding the management capabilities, you must ensure that there are enough replicas (Primary, Secondary, Tie-Breakers) to survive a node failure without bringing down the cluster management.
* Ensure even distribution (Option A): Best practice dictates that MDM roles should be distributed across different failure domains (different racks or chassis) to prevent a single physical failure (like a rack power outage) from taking down the entire MDM cluster simultaneously.
Incorrect Options: MDMs are not assigned to Fault Sets (C)-Fault Sets are for SDSs. Replication protocols (B) are relevant for data disaster recovery, not for the local cluster MDM expansion.
