- B. In high-concurrency scenarios, SDR can be used to configure the AP to operate in dual-radio mode, providing greater throughput.
- C. In large-scale networking, one AP can achieve mixed deployment of multiple modes to meet the needs of different scenarios and save TCO.

NEW QUESTION # 41

When the CloudCampus solution is applied to small or medium-sized campus networks, which description of the access layer design is correct?

- A. When selecting a switch, you need to calculate the number of connected APs * AP power < the power the POE switch can provide. Therefore, you need to choose a POE switch with an appropriate power supply based on the specific model and number of APs.
- B. Select an appropriate access switch model based on whether PoE support is required and the number of access APs.
- C. For micro-store scenarios where AP coverage is required, APs and egress devices must be deployed in the store. APs cannot be directly connected to egress links and do not support NAT.
- D. For medium-sized supermarkets and general education scenarios with large network scales, a stacked network is recommended for the access layer. When a single access device can meet the access density of downstream terminals, a single-device network can be used at the access layer. When the upstream devices at the access layer use a stacked network, an Eth-Trunk link is recommended to connect the upstream devices. If multiple APs are required for coverage, expand AP access using POE LSW.
