Sample Materials NCP-MCA All-in-One Exam Guide

We prepare everything you need to prepare, and help you pass the exam easily. The NCP-MCA exam braindumps of us have the significant information for the exam, if you use it, you will learn the basic knowledge as well as some ways. We offer free update for you, and you will get the latest version timely, and you just need to practice the NCP-MCA Exam Dumps. We believe that with the joint efforts of both us, you will gain a satisfactory result.

Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q53-Q58):

NEW QUESTION # 53

What should be done to scale out an existing Calm environment?

- A. Back up the data and create three Calm VMS from the Calm VM OVA template.
- B. Run cluster destroy on the VM that will be the master Calm VM.
- C. Back up the data and create three Calm VMS from the Calm VM QCOW2 image.
- D. Create new prism Central Scale-Out VMS and enable Calm within the GUI,

Answer: A

Explanation:

According to the Nutanix Calm documentation¹, to scale out an existing Calm environment, the administrator needs to back up the data and create three Calm VMs from the Calm VM OVA template. The administrator then needs to configure the Calm VMs as a cluster and restore the data from the backup. The other options are incorrect because they either do not use the correct image format, do not create a cluster of Calm VMs, or destroy the existing Calm VM. References:

* 1 Nutanix Calm User Guide: Scaling Out the Calm Cluster²

NEW QUESTION # 54

Prism Central reporting indicates that there are multiple memory-constrained VMs in multiple clusters. The target VMs have Memory Hot Add enabled.

Using X-Play, in what order should the Playbook actions be added to ensure the VMs are properly remediated?

- A. Take a VM Snapshot, VM add Memory, Resolve Alert
- B. Take a VM Snapshot, Power Off VM, VM Add Memory, Resolve Alert, Power on VM
- C. Power off VM, Take a VM Snapshot, VM add Memory, Resolve Alert
- D. VM add Memory, Take a VM Snapshot, Resolve Alert

Answer: A

Explanation:

To ensure the VMs are properly remediated, the Playbook actions should be added in the following order:

Take a VM Snapshot, VM add Memory, Resolve Alert. This is because Memory Hot Add allows the administrator to increase the memory allocation of a running VM without powering it off. Taking a VM snapshot before adding memory provides a backup point in case of any issues. Resolving the alert after adding memory clears the notification and updates the status of the VM. Powering off the VM is not necessary and may cause downtime or disruption to the applications running on the VM. NEW QUESTION # 55

What are Self-Service (formerly Calm) Substrates?

- A. Substrates are a combination of the underlying cloud and the virtual machine instance.
- B. Substrates are part of a templating language for Self-Service scripts. These are evaluated by the Self-Service execution before the script is run.
- C. Substrates are runbooks used to accomplish a particular task on an app
- D. Substrates use install and Uninstall operations run when a blueprint is first launched or when the entire app is finally deleted.

Answer: A

Explanation:

In Nutanix Self-Service (formerly known as Calm), substrates refer to the combination of the underlying cloud infrastructure and the virtual machine instances. Substrates define the environment where applications will be deployed and managed, encompassing cloud providers, virtualization platforms, and the associated VM configurations.

References:

* Nutanix Calm documentation on Substrates.

* Nutanix Best Practices for Application Deployment.

NEW QUESTION # 56

What is an Application Profile?

- A. A type of blueprint available to select when creating a new blueprint.
- **B. A capability for a blueprint to provide different combinations of the service, package, and VM while configuring a blueprint.**
- C. A plugin configuration for using Ansible, Chef or Salt.
- D. A function of a Cloud Provider to define an application installation and its configuration possibly including custom code for testing.

Answer: B

Explanation:

In the context of Nutanix Self-Service (Calm) Blueprints, an Application Profile acts as a configuration wrapper that defines a specific variation of the application deployment. 1

* **Combinations:** It allows the blueprint developer to define multiple "sizes" or "flavors" of the same application (e.g., "Small," "Medium," "Large") within a single blueprint.

* **Variables:** Each Application Profile maps specific values to the variables defined in the underlying Services and Packages. For example, the "Small" profile might set the vCPU variable to 2 and the Memory variable to 4GB, while the "Large" profile sets them to 8 and 32GB respectively.

* **User Experience:** When a user launches a blueprint from the Marketplace, they select the desired Application Profile, which then determines the specific infrastructure resources (VM specs) and software packages that get deployed. 2

NEW QUESTION # 57

After an application is no longer needed, a user puts in a ticket to delete the VM. The administrator finds the VM in Prism Central and deletes it, but then realize that it was a Self-Service (formerly Calm) managed VM.

When the administrator attempts the application in Self-Service using the Delete action, it fails because the Substrate cannot be found.

How would the administrator delete the application from management?

- A. Execute the Delete action again, the second run will ignore the error.
- B. In the Audit view of the application, click Retry
- C. The platform Sync Service will remove the application.
- **D. Execute the Soft Delete action to ignore the provide substrate.**

Answer: D

Explanation:

When a VM managed by Self-Service (formerly Calm) is deleted manually from Prism Central, the associated application in Self-Service cannot be deleted using the standard delete action because the substrate is no longer present. In this scenario, the administrator should use the "Soft Delete" action in Self-Service, which will remove the application from management without requiring the substrate to be present.
